Higher

Fifth edition – published March 2002

**NOTE OF CHANGES TO ARRANGEMENTS
FIFTH EDITION PUBLISHED MARCH 2002**

COURSE TITLE: Mathematics (Higher)

**COURSE NUMBERS AND TITLES
FOR ENTRY TO COURSES:**

C100 12 Mathematics: Maths 1, 2 and 3
C102 12 Mathematics: Maths 1, 2 and Stats

National Course Specification

Course Details: Course structure section has been updated to show the new codes and titles **for entry** to courses in Mathematics with optional routes.

National Unit Specification

All Units: No changes.

National Course Specification

MATHEMATICS (HIGHER)

COURSE NUMBERS

C100 12 Mathematics: Maths 1, 2 and 3

C102 12 Mathematics: Maths 1, 2 and Stats

COURSE STRUCTURE

In order to ensure the accurate and complete transfer of data to and from centres, new codes and titles **for entry** to courses in Mathematics with optional routes have been introduced to reflect the options chosen by candidates. The course code C056 12 for Mathematics (Higher) will no longer be acceptable for entry for the summer or winter diets. The codes detailed below must be used.

Unit codes and titles remain unchanged. There will be no change to the titles of the Mathematics courses as they appear on the certificate.

C100 12 Mathematics: Maths 1, 2 and 3

This course consists of three mandatory units as follows:

<i>D321 12</i>	<i>Mathematics 1 (H)</i>	<i>1 credit (40 hours)</i>
<i>D322 12</i>	<i>Mathematics 2 (H)</i>	<i>1 credit (40 hours)</i>
<i>D323 12</i>	<i>Mathematics 3 (H)</i>	<i>1 credit (40 hours)</i>

C102 12 Mathematics: Maths 1, 2 and Stats

This course consists of the three mandatory units as follows:

<i>D321 12</i>	<i>Mathematics 1 (H)</i>	<i>1 credit (40 hours)</i>
<i>D322 12</i>	<i>Mathematics 2 (H)</i>	<i>1 credit (40 hours)</i>
<i>D325 12</i>	<i>Statistics (H)</i>	<i>1 credit (40 hours)</i>

National Course Specification (cont)

COURSE Mathematics (Higher)

In common with all courses, this course includes 40 hours over and above the 120 hours for the component units. This may be used for induction, extending the range of learning and teaching approaches, support, consolidation, integration of learning and preparation for external assessment. This time is an important element of the course and advice on its use is included in the course details.

RECOMMENDED ENTRY

While entry is at the discretion of the centre, candidates will normally be expected to have attained one of the following:

- Standard Grade Mathematics Credit award
- Intermediate 2 Mathematics or its component units including *Mathematics 3 (Int 2)*
- equivalent.

CORE SKILLS

This course gives automatic certification of the following:

Complete core skills for the course Numeracy H

Additional core skills components for the course Critical Thinking H

For information about the automatic certification of core skills for any individual unit in this course, please refer to the general information section at the beginning of the unit.

Additional information about core skills is published in *Automatic Certification of Core Skills in National Qualifications* (SQA, 1999).

National Course Specification: course details

COURSE Mathematics (Higher)

RATIONALE

As with all mathematics courses, Higher Mathematics aims to build upon and extend candidates' mathematical skills, knowledge and understanding in a way that recognises problem solving as an essential skill and enables them to integrate their knowledge of different aspects of the subject.

Because of the importance of these features, the grade descriptions for mathematics emphasise the need for candidates to undertake extended thinking and decision making to solve problems and integrate mathematical knowledge. The use of coursework tasks and statistical assignments to achieve the course grade descriptions in problem solving is encouraged.

The increasing degree of importance of mathematical rigour and the ability to use precise and concise mathematical language as candidates progress in mathematics assumes a particular importance at this stage. Candidates who complete a Higher Mathematics course successfully are expected to have a competence and a confidence in applying mathematical techniques, manipulating symbolic expressions and communicating with mathematical correctness in the solution of problems. It is important, therefore, that, within the course, appropriate attention is given to the acquisition of such expertise whilst extending the candidate's 'toolkit' of knowledge and skills.

Where appropriate, mathematics should be developed in context and the use of mathematical techniques should be applied in social and vocational contexts related to likely progression routes. In particular, the course which contains *Statistics (H)* aims to provide for candidates whose interest lies in areas of work and study where statistical concepts and techniques are important.

The Higher Mathematics course has the particular objective of meeting the needs of candidates at a stage of their education where career aspirations are particularly important. The course has obvious relevance for candidates with interests in fields such as commerce, engineering and science where the mathematics learned will be put to direct use. For other candidates, the course can be an important component of a group award or used to gain entry to a Higher Education institution. All candidates taking the Higher Mathematics course, whatever their career aspirations, should acquire an enhanced awareness of the importance of mathematics to technology and to society in general.

COURSE CONTENT

The syllabus is designed to build upon prior learning in the areas of algebra, geometry, trigonometry and statistics, and to introduce candidates to elementary calculus.

Mathematics 1 (H), *Mathematics 2 (H)* and *Mathematics 3 (H)* are progressive units, each unit covering the range of mathematical topics described above. *Statistics (H)* content includes the following topics: exploratory data analysis, probability and regression analysis.

The outcomes and the performance criteria for each unit are statements of basic competence. Additionally, the course makes demands over and above the requirements of individual units. Candidates should be able to integrate their knowledge across the component units of the course. Some of the 40 hours of flexibility time should be used to ensure that candidates satisfy the grade descriptions for mathematics courses which involve solving problems and which require more extended thinking and decision making. Candidates should be exposed to coursework tasks which require them to interpret problems, select appropriate strategies, come to conclusions and communicate intelligibly. Candidates completing the course which contains *Statistics (H)* should be given the opportunity to complete a short statistical assignment which will require them to collect (generate) the relevant data, analyse the data and interpret and communicate the conclusion.

National Course Specification: course details (cont)

COURSE Mathematics (Higher)

Where appropriate, mathematical topics should be taught and skills in applying mathematics developed through real-life contexts. Candidates should be encouraged, throughout the course, to make efficient use of the arithmetical, mathematical, statistical and graphical facilities on calculators. At the same time, candidates should also be aware of the limitations of the technology and of the importance of always applying the strategy of checking.

Numerical checking or checking a result against the context in which it is set is an integral part of every mathematical process. In many instances, the checking can be done mentally, but on occasions, to stress its importance, there should be evidence of a checking procedure throughout the mathematical or statistical process. There are various checking procedures which could be used:

- relating to a context – ‘How sensible is my answer?’
- estimate followed by a repeated calculation
- calculation in a different order.

It is expected that candidates will be able to demonstrate attainment in the algebraic, trigonometric and calculus content of the course without the use of computer software or sophisticated calculators.

In assessments, candidates are required to show their working in carrying out algorithms and processes.

National Course Specification: course details (cont)

DETAILED CONTENT

The content listed below should be covered in teaching the course. All of this content will be subject to sampling in the external assessment. Part of this assessment will be carried out in a question paper where a calculator will not be allowed. Any of the topics may be sampled in this part of the assessment. The external assessment will also assess problem solving skills, see the grade descriptions on pages 25 and 26. Where comment is offered, this is intended to help in the effective teaching of the course.

References shown in this style of print indicate the depth of treatment appropriate to Grades A and B.

CONTENT	COMMENT
<p>Symbols, terms and sets the symbols: \in, \notin, $\{ \}$</p> <p>the terms: set, subset, empty set, member, element</p> <p>the conventions for representing sets, namely: N, the set of natural numbers, $\{1, 2, 3, \dots\}$ W, the set of whole numbers, $\{0, 1, 2, 3, \dots\}$ Z, the set of integers Q, the set of rational numbers R, the set of real numbers</p> <p>The content listed above is not examinable but candidates are expected to be able to understand its use.</p> <p>Mathematics 1 (H)</p> <p>Properties of the straight line know that the gradient of the line determined by the points (x_1, y_1) and (x_2, y_2) is $\frac{y_2 - y_1}{x_2 - x_1}$, $x_2 \neq x_1$ and that the distance between the points is $\sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$</p>	

National Course Specification: course details (cont)

CONTENT	COMMENT
<p>know that the gradient of a straight line is the tangent of the angle made by the line and the positive direction of the x-axis (scales being equal)</p> <p>recognise the term locus</p> <p>know that the equation of a straight line is of the form $ax + by + c = 0$, and conversely (a, b not both zero)</p> <p>know that the line through (x_1, y_1) with gradient m has equation $y - y_1 = m(x - x_1)$</p> <p>determine the equation of a straight line given two points on the line or one point and the gradient</p> <p>know that the gradients of parallel lines are equal</p> <p>know that the lines with non-zero gradients m_1 and m_2 are perpendicular if and only if $m_1 m_2 = -1$</p> <p>solve mathematical problems involving the above properties of straight lines</p> <p>know the concurrency properties of medians, altitudes, bisectors of the angles and perpendicular bisectors of the sides of a triangle</p>	
<p>Functions and graphs</p> <p>know the meaning of the terms: domain and range of a function, inverse of a function and composite function</p> <p>know the meaning of the terms amplitude and period</p> <p>be aware of the general features of the graphs of $f: x \rightarrow \sin(ax + b)$, $x \rightarrow \cos(ax + b)$ for suitable constants a, b</p>	<p>Candidates should meet all of these concurrency facts, but they could be covered by particular numerical cases only, using plane coordinate methods. However, they can also be established by vector methods and it is possible to explore this work through an investigative approach using an interactive geometry package.</p> <p>The main use of ‘inverse’ is to obtain the logarithmic function from the exponential function. An extended treatment is not required.</p>

National Course Specification: course details (cont)

CONTENT	COMMENT
<p>given the graph of $f(x)$ draw the graphs of related functions, where $f(x)$ is a simple polynomial or trigonometric function</p> <p>know the general features of the graphs of the functions:</p> <p>$f: x \rightarrow a^x$ ($a > 1$ and $0 < a < 1, x \in \mathbf{R}$)</p> <p>$f: x \rightarrow \log_a x$ ($a > 1, x > 0$)</p> <p>use the notation $f(g(x))$ for a composite function and find composite functions of the form $f(g(x))$, given $f(x)$ and $g(x)$</p> <p>recognise the probable form of a function from its graph</p>	<p>Candidates should be fluent in associating functions with their graphs and vice versa: simple polynomial functions and trigonometric functions.</p> <p>eg $y = -f(x), f(x) + 2, 3f(x), f(x + 3), f(x - 1), f'(x)$.</p> <p>eg $y = 3f(x) + 2, f(3x + 2), -3f(x), 3f(x + \frac{\pi}{2})$. [A/B]</p> <p>Candidates should be fluent in associating functions with their graphs and vice versa: logarithmic and exponential functions.</p> <p>Candidates should recognise that $(\frac{1}{2})^x = 2^{-x}$.</p> <p>Graphs of $y = a^x$ for $a = 2, 3$, etc., and for $a = \frac{1}{2}, \frac{1}{3}$, etc. should be explored, and the inverse function of $f: x \rightarrow a^x$ ($a > 1, x \in \mathbf{R}$) should be investigated.</p> <p>Inverse should be used to obtain the logarithmic function from the exponential function.</p> <p>Note: notation $f \circ g$ is not required.</p> <p>Candidates should be able to interpret a diagram containing the sketches of two (or possibly more) relationships, and sketch and annotate the graphs of functions once the critical features, such as points where the graph cuts the coordinate axes and axes of symmetry, as appropriate, have been identified.</p>

CONTENT	COMMENT
<p>Discrete probability distributions</p> <p>know the meaning of the terms <u>probability</u>, outcome and event</p> <p><u>know that probability is a measure of chance between 0 and 1</u></p> <p>use probability <u>defined</u> as: $\frac{\text{no. of favourable outcomes}}{\text{total no. of outcomes}}$</p> <p><u>where all the outcomes are equally likely</u> or by the limit of the relative frequency of the event</p> <p>know the meaning of nC_r and its use in counting outcomes including the notation $\binom{n}{r}$ [A/B]</p> <p>know and understand the following:</p> <ul style="list-style-type: none"> the addition law for mutually exclusive events the multiplication law for independent events replacement and non-replacement situations the meaning of the terms discrete random variable, sample space, probability function and probability distribution 	<p>Probability theory is introduced together with the idea of randomness and simulation.</p> <p>It is appropriate to introduce nC_r through the knowledge of Pascal's Triangle, as a useful aid in the computation of probability, using the definition involving favourable and total outcomes. The addition, multiplication and complement laws of probability can then be investigated, which would naturally include discussion about mutually exclusive and independent events and whether experiments involve replacement or non-replacement. From here, the notion of a random variable together with its probability distribution, mean and standard deviation, presents a natural progression into the world of simulation.</p> <p>Candidates can now be shown the value of tables of random numbers and the generation of random numbers by machine.</p> <p>Statistics relies heavily on the theory of probability. The relevant probability theory must be developed as it is required for statistics, which may be thought of as the modeling of variability and the assessment of uncertainty using random numbers.</p>

National Course Specification: course details (cont)

CONTENT	COMMENT
calculate the probability of an event which involves the laws of probability	eg The probability that a certain phone number is engaged is 0.2. What is the probability that exactly 2 out of the next 3 people who phone this number will find it engaged?
construct the probability distribution of a given random variable	Special distributions, such as binomial, are not required.
calculate the mean and variance of a random variable, as calculated from its probability distribution	
use tables of random numbers and generate random numbers by calculator or computer	
simulate the probability distribution of a random variable, using random numbers	
Continuous probability distributions	
know the meaning of the terms continuous random variable and probability density function	This content serves merely as an introduction to the subject of continuous variables. Probability density functions will be restricted to those types of functions studied in <i>Mathematics 1 (H)</i> , Outcome 3 Basic Differentiation and <i>Mathematics 2 (H)</i> , Outcome 2 Basic Integration.
calculate probability from a probability density function of a continuous random variable by integration	Knowledge of the normal distribution is not required but could well be used for illustrative purposes together with normal tables.
determine cumulative probability from a probability density function by integration	
determine the mean and variance of a continuous random variable from its probability density function.	
determine the median and mode of a continuous random variable from its probability density function.	Although the median and mode are not used much in practice they do serve as an illustration of the use of calculus from <i>Mathematics 1 (H)</i> and <i>2 (H)</i> .

National Course Specification: course details (cont)

CONTENT	COMMENT
<p>The relationship between two variables know the meaning of the terms linear regression, regression of y on x, residual, interpolation, extrapolation and correlation</p> <p>determine least squares regression line of y on x, given by $y = \alpha + \beta x$ where estimates for α and β, ie a and b, are given by $a = \bar{y} - b\bar{x} \quad \text{and} \quad b = \frac{\sum(x - \bar{x})(y - \bar{y})}{\sum(x - \bar{x})^2}$ respectively</p> <p>predict values using the regression line</p> <p>calculate the product moment correlation coefficient and interpret the result</p>	<p>Note that it is assumed that candidates are familiar with the construction and interpretation of scattergraphs (see Intermediate 1 and 2).</p> <p>Modern technology commonly uses 'a' as an estimate of α, the intercept and 'b' as an estimate of β, the gradient of the regression line.</p> <p>Estimation is appropriate if the points are close to a straight line, as demonstrated by a scattergraph and high correlation showing a strong linear association between the variables.</p> <p>Candidates should be able to relate correlation coefficients to appropriate scattergraphs, noting that the product moment correlation coefficient is a measure of linear fit.</p>

National Course Specification: course details (cont)

COURSE Mathematics (Higher)

ASSESSMENT

To gain the award of the course, the candidate must pass all the unit assessments as well as the external assessment. External assessment will provide the basis for grading attainment in the course award.

When units are taken as component parts of a course, candidates should have the opportunity to achieve at levels beyond that required to attain each of the unit outcomes. This attainment may, where appropriate, be recorded and used to contribute towards course estimates and to provide evidence for appeals. Additional details are provided, where appropriate, with the exemplar assessment materials. Further information on the key principles of assessment are provided in the paper, *Assessment* (HSDU, 1996) and in *Managing Assessment* (HSDU, 1998).

DETAILS OF THE INSTRUMENTS FOR EXTERNAL ASSESSMENT

The external assessment will take the form of an examination of 2 hours and 40 minutes' duration. Candidates will sit either a paper assessing *Mathematics 1 (H)*, *Mathematics 2 (H)* and *Mathematics 3 (H)* or one assessing *Mathematics 1 (H)*, *Mathematics 2 (H)* and *Statistics (H)*. The external examination will test the candidate's ability to retain and integrate mathematical knowledge across the component units of the course. Each examination will consist of two papers, one of which will not allow the use of a calculator. The two papers will contain a balance of short questions designed mainly to test knowledge and understanding and extended response questions which also test problem solving skills. These two styles of questions will include ones which are set in more complex contexts to provide evidence for performance at Grades A and B.

The papers will be designed so that approximately 60% of the marks will be opportunities at Grade C.

GRADE DESCRIPTIONS

Higher Mathematics courses should enable candidates to solve problems that integrate mathematical knowledge across performance criteria, outcomes and units, and which require extended thinking and decision making. The award of Grades A, B and C is determined by the candidate's demonstration of the ability to apply knowledge and understanding to problem-solving. To achieve Grades A and B in particular, this demonstration will involve more complex contexts including the depth of treatment indicated in the detailed content tables.

In solving problems, candidates should be able to:

- a) interpret the problem and consider what might be relevant;
- b) decide how to proceed by selecting an appropriate strategy;
- c) implement the strategy through applying mathematical knowledge and understanding and come to a conclusion;
- d) decide on the most appropriate way of communicating the solution to the problem in an intelligible form.

Familiarity and complexity affect the level of difficulty of problems. It is generally easier to interpret and communicate information in contexts where the relevant variables are obvious and where their inter relationships are known. It is usually more straightforward to apply a known strategy than to modify one or devise a new one. Some concepts are harder to grasp and some techniques more difficult to apply, particularly if they have to be used in combination.

National Course Specification: course details (cont)

COURSE Mathematics (Higher)

Exemplification of problem solving at Grade C and Grade A

a) **Interpret the problem and consider what might be relevant**

At Grade C candidates should be able to interpret qualitative and quantitative information as it arises within:

- the description of real-life situations
- the context of other subjects
- the context of familiar areas of mathematics.

Grade A performance is demonstrated through coping with the interpretation of more complex contexts requiring a higher degree of reasoning ability in the areas described above.

b) **Decide how to proceed by selecting an appropriate strategy**

At Grade C candidates should be able to tackle problems by selecting an algorithm, or sequence of algorithms, drawn from related areas of mathematics, or a heuristic strategy.

Grade A performance is demonstrated through an ability to decide on and apply a more extended sequence of algorithms to more complex contexts.

c) **Implement the strategy through applying mathematical knowledge and understanding and come to a conclusion**

At Grade C candidates should be able to use their knowledge and understanding to carry through their chosen strategy and come to a conclusion. They should be able to process data in numerical and symbolic form with appropriate regard for accuracy, marshal facts, sustain logical reasoning and appreciate the requirements of proof.

Grade A performance is demonstrated through an ability to cope with processing data in more complex situations, and sustaining logical reasoning, where the situation is less readily identifiable with a standard form.

d) **Decide on the most appropriate way of communicating the solution to the problem in an intelligible form**

At Grade C candidates should be able to communicate qualitative and quantitative mathematical information intelligibly and to express the solution in language appropriate to the situation.

Grade A performance is demonstrated through an ability to communicate intelligibly in more complex situations and unfamiliar contexts.

National Course Specification: course details (cont)

COURSE Mathematics (Higher)

APPROACHES TO LEARNING AND TEACHING

The learning and teaching process should foster positive attitudes to the subject. Exposition to a group or class remains an essential technique at this level, and active candidate involvement in learning should be encouraged through questioning and discussion. However, investigative approaches to learning should also feature prominently in the delivery of the Higher course. Where appropriate, new skills and concepts should be introduced within a context and, when suitable, through an investigative approach, sometimes giving candidates the opportunity to work co-operatively. Coursework tasks can support these approaches, and simultaneously allow the grade descriptions for extended problem solving to be met.

Opportunities should be taken to justify the need for new skills by reference to real problems. While the contexts may include familiar and everyday ones, they should also make use of situations from other subjects, or from areas of interest to candidates in their future study. Contexts which are purely mathematical will also be appropriate, for example, some aspects of quadratic theory might be illustrated in the context of tangency, *Mathematics 2 (H)*.

Wherever possible, candidates should be encouraged to make use of technology. Calculators have great potential provided they are used appropriately and not allowed to provide unnecessary support, nor substitute for personal proficiency. This balance between 'basic skills' and appropriate use of technology is essential. Calculators with mathematical and graphical facilities and those with computer algebra systems (CAS) can be utilised as powerful tools both for processing data, especially in the study of statistics, and for reinforcing mathematical concepts. The use of such calculators should help candidates gain confidence in making conjectures based on numerical or graphical evidence. Candidates should be aware that errors are inevitably introduced in the course of computation or in the limitations of the graphical display.

Computers can also make a significant contribution to learning and teaching. The use of software packages in statistics will enhance the learning and teaching and allow candidates greater flexibility through ease of computation and display.

It is envisaged that increased availability and advances in technology will have a continuing and increasing influence in approaches to learning and teaching at this level.

SPECIAL NEEDS

This course specification is intended to ensure that there are no artificial barriers to learning or assessment. Special needs of individual candidates should be taken into account when planning learning experiences, selecting assessment instruments or considering alternative outcomes for units. For information on these, please refer to the SQA document *Guidance on Special Assessment and Certification Arrangements for Candidates with Special Needs/Candidates whose First Language is not English* (SQA, 1998).

National Course Specification: course details (cont)

COURSE Mathematics (Higher)

SUBJECT GUIDES

A Subject Guide to accompany the Arrangements document has been produced by the Higher Still Development Unit (HSDU) in partnership with the Scottish Consultative Council on the Curriculum (SCCC) and Scottish Further Education Unit (SFEU). The Guide provides further advice and information about:

- support materials for each course
- learning and teaching approaches in addition to the information provided in the Arrangements document
- assessment
- ensuring appropriate access for candidates with special educational needs

The Subject Guide is intended to support the information contained in the Arrangements document. The SQA Arrangements documents contain the standards against which candidates are assessed.

National Course Specification: general information

UNIT	Mathematics 1 (Higher)
NUMBER	D321 12
COURSE	Mathematics (Higher)

SUMMARY

Mathematics 1 (H) comprises outcomes in algebra, geometry, graphicacy and elementary calculus. It is a mandatory unit of the Higher Mathematics course and provides a basis for progression to *Mathematics 2 (H)*.

OUTCOMES

- 1 Use the properties of the straight line.
- 2 Associate functions and graphs.
- 3 Use basic differentiation.
- 4 Design and interpret mathematical models of situations involving recurrence relations.

RECOMMENDED ENTRY

While entry is at the discretion of the centre, candidates will normally be expected to have attained one of the following:

- Standard Grade Mathematics Credit award
- Intermediate 2 Mathematics or its component units including *Mathematics 3 (Int 2)*
- equivalent.

CREDIT VALUE

1 credit at Higher level.

Administrative Information

Superclass:	RB
Publication date:	December 1999
Source:	Scottish Qualifications Authority
Version:	04

This publication may be reproduced in whole or in part for educational purposes provided that no profit is derived from reproduction and that, if reproduced in part, the source is acknowledged.

Additional copies of this unit specification can be purchased from the Scottish Qualifications Authority. The cost for each unit specification is £2.50 (minimum order £5).

National Unit Specification: general information (cont)

UNIT Mathematics 1 (Higher)

CORE SKILLS

This unit gives automatic certification of the following:

Complete core skills for the unit Numeracy H

Additional core skills components for the unit Critical Thinking H

Additional information about core skills is published in *Automatic Certification of Core Skills in National Qualifications* (SQA, 1999).

National Unit Specification: statement of standards

UNIT Mathematics 1 (Higher)

Acceptable performance in this unit will be the satisfactory achievement of the standards set out in this part of the unit specification. All sections of the statement of standards are mandatory and cannot be altered without reference to the Scottish Qualifications Authority.

OUTCOME 1

Use the properties of the straight line.

Performance criteria

- Determine the equation of a straight line given two points on the line or one point and the gradient.
- Find the gradient of a straight line using $m = \tan \theta$.
- Find the equation of a line parallel to and a line perpendicular to a given line.

OUTCOME 2

Associate functions and graphs.

Performance criteria

- Sketch and identify related graphs and functions.
- Identify exponential and logarithmic graphs.
- Find composite functions of the form $f(g(x))$, given $f(x)$ and $g(x)$.

OUTCOME 3

Use basic differentiation.

Performance criteria

- Differentiate a function reducible to a sum of powers of x .
- Determine the gradient of a tangent to a curve by differentiation.
- Determine the coordinates of the stationary points on a curve and justify their nature using differentiation.

OUTCOME 4

Design and interpret mathematical models of situations involving recurrence relations.

Performance criteria

- Define and interpret a recurrence relation in the form $u_{n+1} = mu_n + c$ (m, c constants) in a mathematical model.
- Find and interpret the limit of the sequence generated by a recurrence relation in a mathematical model (where the limit exists).

Evidence requirements

Although there are various ways of demonstrating achievement of the outcomes, evidence would normally be presented in the form of a closed book test under controlled conditions. Examples of such tests are contained in the National Assessment Bank.

In assessment, candidates are required to show their working in carrying out algorithms and processes.

National Unit Specification: support notes

UNIT Mathematics 1 (Higher)

This part of the unit specification is offered as guidance. The support notes are not mandatory.

While the time allocated to this unit is at the discretion of the centre, the notional design length is 40 hours.

GUIDANCE ON THE CONTENT AND CONTEXT FOR THIS UNIT

Each mathematics unit at Higher level aims to build upon and extend candidates' mathematical knowledge and skills. Within this unit, study of coordinate geometry of the straight line, algebra and trigonometry, with the emphasis on graphicacy, is taken to a greater depth. Previous experience of number patterns is formalised in the context of recurrence relations and differential calculus is introduced.

The increasing degree of importance of mathematical rigour and the ability to use precise and concise mathematical language as candidates progress in mathematics assumes a particular importance at this stage. Candidates working at this level are expected to acquire a competence and a confidence in applying mathematical techniques, manipulating symbolic expressions and communicating with mathematical correctness in the solution of problems. It is important, therefore, that, within this unit, appropriate attention is given to the acquisition of such expertise whilst extending the candidate's 'toolkit' of knowledge and skills.

The recommended content for this unit can be found in the course specification. The *detailed content* section provides illustrative examples to indicate the depth of treatment required to achieve a unit pass and advice on teaching approaches.

GUIDANCE ON LEARNING AND TEACHING APPROACHES FOR THIS UNIT

Where appropriate, mathematical topics should be taught and skills in applying mathematics developed through real-life contexts. Candidates should be encouraged throughout this unit to make efficient use of the arithmetical, mathematical and graphical features of calculators, as well as basic non-calculator skills. Candidates should be aware of the limitations of the technology and always apply the strategy of checking.

Numerical checking or checking a result against the context in which it is set is an integral part of every mathematical process. In many instances, the checking can be done mentally, but on occasions, to stress its importance, attention should be drawn to relevant checking procedures throughout the mathematical process. There are various checking procedures which could be used:

- relating to a context – 'How sensible is my answer?'
- estimate followed by a repeated calculation
- calculation in a different order.

Further advice on learning and teaching approaches is contained within the Subject Guide for Mathematics.

National Unit Specification: support notes (cont)

UNIT Mathematics 1 (Higher)

GUIDANCE ON APPROACHES TO ASSESSMENT FOR THIS UNIT

The assessment for this unit will normally be in the form of a closed book test. Such tests should be carried out under supervision and it is recommended that candidates attempt an assessment designed to assess all the outcomes within the unit. Successful achievement of the unit is demonstrated by candidates achieving the thresholds of attainment specified for all outcomes in the unit. Candidates who fail to achieve the threshold(s) of attainment need only be retested on the outcome(s) where the outcome threshold score has not been attained. Further advice on assessment and retesting is contained within the National Assessment Bank.

It is expected that candidates will be able to achieve the algebraic, trigonometric and calculus performance criteria of the unit without the use of computer software or sophisticated calculators.

In assessments, candidates should be required to show their working in carrying out algorithms and processes.

SPECIAL NEEDS

This unit specification is intended to ensure that there are no artificial barriers to learning or assessment. Special needs of individual candidates should be taken into account when planning learning experiences, selecting assessment instruments or considering alternative outcomes for units. For information on these, please refer to the SQA document *Guidance on Special Assessment and Certification Arrangements for Candidates with Special Needs/Candidates whose First Language is not English* (SQA, 1998).

National Unit Specification: general information

UNIT Mathematics 2 (Higher)

NUMBER D322 12

COURSE Mathematics (Higher)

SUMMARY

Mathematics 2 (H) comprises topics in algebra, geometry, trigonometry and elementary calculus. It is a mandatory unit of the Higher Mathematics course and provides a basis for progression to *Mathematics 3 (H)*.

OUTCOMES

- 1 Use the Factor/Remainder Theorem and apply quadratic theory.
- 2 Use basic integration.
- 3 Solve trigonometric equations and apply trigonometric formulae.
- 4 Use the equation of the circle.

RECOMMENDED ENTRY

While entry is at the discretion of the centre, candidates would normally be expected to have attained one of the following:

- *Mathematics 1 (H)*
- equivalent.

CREDIT VALUE

1 credit at Higher level.

National Unit Specification: general information (cont)

UNIT Mathematics 2 (Higher)

CORE SKILLS

This unit gives automatic certification of the following:

Complete core skills for the unit	None
Core skills components for the unit	Critical Thinking H Using Number H

Additional information about core skills is published in *Automatic Certification of Core Skills in National Qualifications* (SQA, 1999).

National Unit Specification: statement of standards

UNIT Mathematics 2 (Higher)

Acceptable performance in this unit will be the satisfactory achievement of the standards set out in this part of the unit specification. All sections of the statement of standards are mandatory and cannot be altered without reference to the Scottish Qualifications Authority.

OUTCOME 1

Use the Factor/Remainder Theorem and apply quadratic theory.

Performance criteria

- a) Apply the Factor/Remainder Theorem to a polynomial function.
- b) Determine the nature of the roots of a quadratic equation using the discriminant.

OUTCOME 2

Use basic integration.

Performance criteria

- a) Integrate functions reducible to the sums of powers of x (definite and indefinite).
- b) Find the area between a curve and the x -axis using integration.
- c) Find the area between two curves using integration.

OUTCOME 3

Solve trigonometric equations and apply trigonometric formulae.

Performance criteria

- a) Solve a trigonometric equation in a given interval.
- b) Apply a trigonometric formula (addition formula) in the solution of a geometric problem.
- c) Solve a trigonometric equation involving an addition formula in a given interval.

OUTCOME 4

Use the equation of the circle.

Performance criteria

- a) Given the centre (a, b) and radius r , find the equation of the circle in the form $(x-a)^2 + (y-b)^2 = r^2$.
- b) Find the radius and centre of a circle given the equation in the form $x^2 + y^2 + 2gx + 2fy + c = 0$.
- c) Determine whether a given line is a tangent to a given circle.
- d) Determine the equation of the tangent to a given circle given the point of contact.

Evidence requirements

Although there are various ways of demonstrating achievement of the outcomes, evidence would normally be presented in the form of a closed book test under controlled conditions. Examples of such tests are contained in the National Assessment Bank.

In assessments, candidates are required to show their working in carrying out algorithms and processes.

National Unit Specification: support notes

UNIT Mathematics 2 (Higher)

This part of the unit specification is offered as guidance. The support notes are not mandatory.

While the time allocated to this unit is at the discretion of the centre, the notional design length is 40 hours.

GUIDANCE ON THE CONTENT AND CONTEXT FOR THIS UNIT

Each mathematics unit at Higher level aims to build upon and extend candidates' mathematical knowledge and skills. Within this unit, the coordinate geometry of *Mathematics 1(H)* is extended to include the circle. The Factor/Remainder Theorem and quadratic theory and addition formulae are added to previous experience in algebra and trigonometry respectively. Basic integration is introduced to extend the calculus of *Mathematics 1(H)*.

The increasing degree of importance of mathematical rigour and the ability to use precise and concise mathematical language as candidates progress in mathematics assumes a particular importance at this stage. Candidates working at this level are expected to acquire a competence and a confidence in applying mathematical techniques, manipulating symbolic expressions and communicating with mathematical correctness in the solution of problems. It is important, therefore, that, within this unit, appropriate attention is given to the acquisition of such expertise whilst extending the candidate's 'toolkit' of knowledge and skills.

The recommended content for this unit can be found in the course specification. The *detailed content* section provides illustrative examples to indicate the depth of treatment required to achieve a unit pass and advice on teaching approaches.

GUIDANCE ON LEARNING AND TEACHING APPROACHES FOR THIS UNIT

Where appropriate, mathematical topics should be taught and skills in applying mathematics developed through real-life contexts. Candidates should be encouraged throughout this unit to make efficient use of the arithmetical, mathematical and graphical features of calculators, as well as basic non-calculator skills. Candidates should be aware of the limitations of the technology and always apply the strategy of checking.

Numerical checking or checking a result against the context in which it is set is an integral part of every mathematical process. In many instances, the checking can be done mentally, but on occasions, to stress its importance, attention should be drawn to relevant checking procedures throughout the mathematical process. There are various checking procedures which could be used:

For information on these, please refer to the SQA document *Guidance on Special Assessment and Certification Arrangements for Candidates with Special Needs/Candidates whose First Language is not English* (SQA, 1998).

National Unit Specification: general information

UNIT Mathematics 3 (Higher)

NUMBER D323 12

COURSE Mathematics (Higher)

SUMMARY

This optional unit is the third of three progressive units which comprise the Higher Mathematics course. *Mathematics 3 (H)* comprises outcomes in algebra, geometry, trigonometry and elementary calculus at Higher level.

OUTCOMES

- 1 Use vectors in three dimensions.
- 2 Use further differentiation and integration.
- 3 Use properties of logarithmic and exponential functions.
- 4 Apply further trigonometric relationships.

RECOMMENDED ENTRY

While entry is at the discretion of the centre, candidates would normally be expected to have attained:

- *Mathematics 2 (H)*
- equivalent.

CREDIT VALUE

1 credit at Higher level.

Administrative Information

Superclass: RB

Publication date: December 1999

Additional copies of this unit specification can be purchased from the Scottish Qualifications Authority. The cost for each unit specification is £2.50 (minimum order £5).

National Unit Specification: general information (cont)

UNIT Mathematics 3 (Higher)

CORE SKILLS

This unit gives automatic certification of the following:

Complete core skills for the unit	None
Core skills components for the unit	Critical Thinking H Using Number H

Additional information about core skills is published in *Automatic Certification of Core Skills in National Qualifications* (SQA, 1999).

National Unit Specification: statement of standards

UNIT Mathematics 3 (Higher)

Acceptable performance in this unit will be the satisfactory achievement of the standards set out in this part of the unit specification. All sections of the statement of standards are mandatory and cannot be altered without reference to the Scottish Qualifications Authority.

OUTCOME 1

Use vectors in three dimensions.

Performance criteria

- Determine whether three points with given coordinates are collinear.
- Determine the coordinates of the point which divides the join of two given points internally in a given numerical ratio.
- Use the scalar product.

OUTCOME 2

Use further differentiation and integration.

Performance criteria

- Differentiate $k \sin x$, $k \cos x$.
- Differentiate using the function of a function rule.
- Integrate functions of the form $f(x) = (x + q)^n$, n rational except for -1 , $f(x) = p \cos x$ and $f(x) = p \sin x$.

OUTCOME 3

Use properties of logarithmic and exponential functions.

Performance criteria

- Simplify a numerical expression using the laws of logarithms.
- Solve simple logarithmic and exponential equations.

OUTCOME 4

Apply further trigonometric relationships.

Performance criteria

- Express $a \cos \theta + b \sin \theta$ in the form $r \cos (\theta \pm \alpha)$ or $r \sin (\theta \pm \alpha)$.

Evidence requirements

Although there are various ways of demonstrating achievement of the outcomes, evidence would normally be presented in the form of a closed book test under controlled conditions. Examples of such tests are contained in the National Assessment Bank.

In assessments, candidates are required to show their working in carrying out algorithms and processes.

National Unit Specification: support notes

UNIT Mathematics 3 (Higher)

This part of the unit specification is offered as guidance. The support notes are not mandatory.

While the exact time allocated to this unit is at the discretion of the centre, the notional design length is 40 hours.

GUIDANCE ON THE CONTENT AND CONTEXT FOR THIS UNIT

Each mathematics unit at Higher level aims to build upon and extend candidates' mathematical knowledge and skills. This optional unit is designed to continue the study of mathematics in the areas of algebra, geometry, trigonometry and calculus, and to provide a basis for the study of more advanced mathematics and applied mathematics.

Within this unit, the coordinate geometry of *Mathematics 1(H)* and *Mathematics 2(H)* is broadened into a three dimensional context with the introduction of vector notation and applications. Calculus is further extended to include differentiation and integration of the sine and cosine functions and the rules for integrating and differentiating composite functions. The exponential and logarithmic functions introduced graphically in *Mathematics 1(H)* are used in applications, and further trigonometry is studied in the context of the wave function.

The increasing degree of importance of mathematical rigour and the ability to use precise and concise mathematical language as candidates progress in mathematics assumes a particular importance at this stage. Candidates working at this level are expected to acquire a competence and a confidence in applying mathematical techniques, manipulating symbolic expressions and communicating with mathematical correctness in the solution of problems. It is important, therefore, that, within this unit, appropriate attention is given to the acquisition of such expertise whilst extending the candidate's 'toolkit' of knowledge and skills.

The recommended content for this unit can be found in the course specification. The *detailed content* section provides illustrative examples to indicate the depth of treatment required to achieve a unit pass and advice on teaching approaches.

GUIDANCE ON LEARNING AND TEACHING APPROACHES FOR THIS UNIT

Where appropriate, mathematical topics should be taught and skills in applying mathematics developed through real-life contexts. Candidates should be encouraged throughout this unit to make efficient use of the arithmetical, mathematical and graphical features of calculators as well as basic non-calculator skills. Candidates should be aware of the limitations of the technology and always apply the strategy of checking.

Numerical checking or checking a result against the context in which it is set is an integral part of every mathematical process. In many instances, the checking can be done mentally, but on occasions, to stress its importance, attention should be drawn to relevant checking procedures throughout the mathematical process. There are various checking procedures which could be used:

- relating to a context – 'How sensible is my answer?'
- estimate followed by a repeated calculation
- calculation in a different order.

Further advice on learning and teaching approaches is contained within the Subject Guide for Mathematics.

National Unit Specification: support notes (cont)

UNIT Mathematics 3 (Higher)

GUIDANCE ON APPROACHES TO ASSESSMENT FOR THIS UNIT

The assessment for this unit will normally be in the form of a closed book test. Such tests should be carried out under supervision and it is recommended that candidates attempt an assessment designed to assess all the outcomes within the unit. Successful achievement of the unit is demonstrated by candidates achieving the thresholds of attainment specified for all outcomes in the unit. Candidates who fail to achieve the threshold(s) of attainment need only be retested on the outcome(s) where the outcome threshold score has not been attained. Further advice on assessment and retesting is contained within the National Assessment Bank.

It is expected that candidates will be able to achieve the algebraic, trigonometric and calculus performance criteria of the unit without the use of computer software or sophisticated calculators.

In assessments, candidates are required to show their working in carrying out these algorithms and processes.

SPECIAL NEEDS

This unit specification is intended to ensure that there are no artificial barriers to learning or assessment. Special needs of individual candidates should be taken into account when planning learning experiences, selecting assessment instruments or considering alternative outcomes for units. For information on these, please refer to the SQA document *Guidance on Special Assessment and Certification Arrangements for Candidates with Special Needs/Candidates whose First Language is not English* (SQA, 1998).

National Unit Specification: general information

UNIT	Statistics (Higher)
NUMBER	D325 12
COURSE	Mathematics (Higher)

SUMMARY

Statistics (H) is an optional unit of the Higher Mathematics course which is designed to provide a statistics specialism, and to form the basis from which further study of statistics can be developed. Outcome 2 is necessary for the work in Advanced Higher *Statistics 1*, while experience of Outcomes 1 and 4 is advantageous for that work.

OUTCOMES

- 1 Interpret an Exploratory Data Analysis (EDA) on a data set.
- 2 Work with discrete probability distributions.
- 3 Work with continuous probability distributions.
- 4 Analyse the relationship between two variables.

RECOMMENDED ENTRY

While entry is at the discretion of the centre, candidates will normally be expected to have attained one of the following:

- Standard Grade Mathematics Credit award
- Intermediate 2 Mathematics award or its component units
- equivalent.

In particular the statistical content of *Mathematics 2 (Int 2)* provides an appropriate basis for *Statistics (H)*.

CREDIT VALUE

1 credit at Higher level.

National Unit Specification: general information (cont)

UNIT Statistics (Higher)

CORE SKILLS

This unit gives automatic certification of the following:

Complete core skills for the unit Numeracy H

Additional core skills components for the unit Critical Thinking H

Additional information about core skills is published in *Automatic Certification of Core Skills in National Qualifications* (SQA, 1999).

National Unit Specification: statement of standards

UNIT Statistics (Higher)

Acceptable performance in this unit will be the satisfactory achievement of the standards set out in this part of the unit specification. All sections of the statement of standards are mandatory and cannot be altered without reference to the Scottish Qualifications Authority.

OUTCOME 1

Interpret an Exploratory Data Analysis (EDA) on a data set.

Performance criteria

- a) Interpret the results of an EDA.

OUTCOME 2

Work with discrete probability distributions.

Performance criteria

- a) Calculate the probability of an event which involves the laws of probability.
- b) Construct the probability distribution of a given random variable.
- c) Calculate the mean and variance of a random variable.
- d) Simulate the behaviour of a random variable.

OUTCOME 3

Work with continuous probability distributions.

Performance criteria

- a) Calculate probability from the density function of a continuous random variable.
- b) Obtain the mean and variance of a continuous random variable.

OUTCOME 4

Analyse the relationship between two variables.

Performance criteria

- a) Determine the equation of linear regression and use it for prediction.
- b) Calculate the correlation coefficient and interpret the result.

Evidence requirements

Although there are various ways of demonstrating achievement of the outcomes, evidence would normally be presented in the form of a closed book test under controlled conditions. Examples of such tests are contained in the National Assessment Bank.

National Unit Specification: support notes

UNIT Statistics (Higher)

This part of the unit specification is offered as guidance. The support notes are not mandatory.

While the time allocated to this unit is at the discretion of the centre, the notional design length is 40 hours.

GUIDANCE ON THE CONTENT AND CONTEXT FOR THIS UNIT

Each mathematics unit at Higher level aims to build upon and extend candidates' mathematical knowledge and skills. This optional unit extends the statistical content of Intermediate 1 and 2, and is designed mainly to provide a statistics specialism at Higher level in acknowledgment of the extensive use of statistical processes in many occupations and other areas of study.

Exploratory Data Analysis (a method of achieving a quick and simple analysis of a sample data set) unifies the inferential statistics contained in *Mathematics 2 (Int 1)* and *Mathematics 2 (Int 2)* in Outcome 1.

In Outcomes 2 and 3, discrete and continuous probability distributions are studied in some depth, allowing for discussion of randomness and simulation. The mathematics of continuous probability functions provide a link with the calculus contained in *Mathematics 2 (H)*.

Outcome 4 formalises and extends the work on scattergraphs at Intermediate 2 level to regression analysis and the calculation of the correlation coefficient.

The recommended content for this unit can be found in the course specification. The *detailed content* section provides illustrative examples to indicate the depth of treatment required to achieve a unit pass and advice on teaching approaches.

Where possible, candidates should be given the opportunity to apply the statistics of this unit through a short statistical assignment which will require them to collect (generate) the relevant data, analyse the data and interpret and communicate the conclusion. This assignment does not require to be formally assessed.

GUIDANCE ON LEARNING AND TEACHING APPROACHES FOR THIS UNIT

Where appropriate, statistical topics should be taught and skills in applying statistics developed through real-life contexts. Candidates should be encouraged, throughout this unit, to make efficient use of the arithmetical, mathematical, statistical and graphical features of calculators as well as basic non-calculator skills. Candidates should be aware of the limitations of the technology and always apply the strategy of checking.

Numerical checking or checking a result against the context in which it is set is an integral part of every mathematical process. In many instances, the checking can be done mentally, but on occasions, to stress its importance, attention should be drawn to relevant checking procedures throughout the mathematical process. There are various checking procedures which could be used:

- relating to a context – ‘How sensible is my answer?’
- estimate followed by a repeated calculation
- calculation in a different order.

Further advice on learning and teaching approaches is contained within the Subject Guide for Mathematics.
