Appendix 2: Reference documents	22

# Introduction

These support notes are not mandatory. They provide advice and guidance on approaches to delivering and assessing the Advanced Higher Engineering Science Course. They are intended for teachers and lecturers who are delivering the Course and its Units. They should be read in conjunction with the *Course Specification*, the *Course Assessment Specification* and the *Unit Specifications* for the Units in the Course.

These support notes cover both the Advanced Higher Course and the Units in it.

Draft

# General guidance on the Course/Units

## Aims

The aims of the Course are to enable learners to:

- ◆ extend and apply knowledge and understanding of key engineering concepts, principles and practice through independent learning
- ◆ understand and apply the relationships between engineering, mathematics and science
- ◆ develop skills in investigation and research in an engineering context
- ◆ analyse, design, construct and evaluate creative solutions to complex engineering problems
- ◆ communicate advanced engineering concepts clearly and concisely, using appropriate terminology
- ◆ develop an informed understanding of the role and impact of engineering in changing and influencing our environment and society, including ethical implications

## Progression

In order to do this Course, learners should have achieved the Higher Engineering Science Course.

Learners who have achieved this Advanced Higher Course may progress to further study, employment and/or training. Opportunities for progression include:

- ◆ Progression to further/higher education
  - For many learners a key transition point will be to further or higher education, for example to Higher National Certificates (HNCs)/Higher National Diplomas (HNDs) or degree programmes. Examples of further and higher education programmes that learners might progress to are degree programmes in various branches of Engineering or Physics.
  - This Course provides good preparation for learners progressing to further and higher education as learners doing Advanced Higher Courses must be able to work with more independence and less supervision. This eases their transition to further/higher education. Advanced Higher Courses may also allow 'advanced standing' or partial credit towards the first year of study of a degree programme.
  - Advanced Higher Courses are challenging and testing qualifications — learners who have achieved multiple Advanced Higher Courses are regarded as having a proven level of ability, which attests to their readiness for higher education in Higher Education Institutions in other parts of the UK as well as in Scotland.

This Advanced Higher could be part of the Scottish Baccalaureate in Science. The Scottish Baccalaureates in Expressive Arts, Languages, Science and Social Sciences consist of coherent groups of subjects at Higher and Advanced Higher level. Each award consists of two Advanced Highers, one Higher and an interdisciplinary project that adds breadth and value, helping learners to develop generic skills, attitudes and confidence that will help them make the transition into higher education or employment.

## Hierarchies

**Hierarchy** is the term used to describe Courses and Units that form a structured progression involving two or more SCQF levels.

It is important that any content in a Course and/or Unit at one particular SCQF level is not repeated if a learner progresses to the next level of the hierarchy. The skills and knowledge should be able to be applied to new content and contexts to enrich the learning experience. This is for centres to manage.

This Course is designed in hierarchy with the corresponding Course at Higher and has the same Course structure and the same or similar Unit titles as the Higher Course. A hierarchical arrangement enables learners to work at different levels carrying out similar activities, with their work being differentiated and benchmarked against the Assessment Standards and Evidence Requirements at different SCQF levels.

Centres should be aware that although the mandatory knowledge and skillset may be similar across the hierarchical Units in Higher and Advanced Higher Courses, there may be differences in the:

- ◆ depth of underpinning knowledge and understanding
- ◆ complexity and sophistication of the applied skills
- ◆ way in which learners will learn: namely, they will take more responsibility for their learning at Advanced Higher and work more autonomously

Appendix 1 contains a table showing the relationship between the mandatory Higher and Advanced Higher knowledge and understanding. This table may be useful for:

- ◆ ensuring seamless progression between levels
- ◆ identifying important prior learning for learners at Advanced Higher

Teachers should also refer to the Outcomes and Assessment Standards for each level when planning delivery.

# Skills, knowledge and understanding covered in this Course

This section provides further advice and guidance about skills, knowledge and understanding that could be included in the Course.

Teachers and lecturers should refer to the *Course Assessment Specification* for mandatory information about the skills, knowledge and understanding to be covered in this Course.

The development of subject specific and generic skills is central to the Course. Learners should be made aware of the skills they are developing and of the transferability of them. It is the transferability that will help learners with further study and enhance their personal effectiveness.

The table below shows where there are likely to be opportunities to develop mandatory skills in or across the Units. However, the delivery mode adopted and the approaches to learning and teaching will determine how and where the opportunities arise.

<b>Mandatory skills and knowledge</b>	<b>Eng. Project Management</b>	<b>Electronics and Control</b>	<b>Mechanisms and Structures</b>	<b>Course assessment</b>
researching and investigating complex engineering problems		✓	✓	✓
designing, developing, simulating, building, testing and evaluating solutions to complex engineering problems in a range of contexts		✓	✓	✓
applying mathematical techniques to analyse and solve engineering problems		✓	✓	✓
communicating complex engineering concepts clearly and concisely using appropriate terminology	✓	✓	✓	✓
knowledge and understanding of the wide role and impact of engineering on society and the environment, including ethical implications	✓			✓
in-depth knowledge and understanding of aspects of electronic and microcontroller-based systems, and their application		✓		✓
in-depth knowledge and understanding of aspects of mechanisms and structures, and their application			✓	✓
knowledge and understanding of the relevance of energy, efficiency and sustainability to complex engineering problems and solutions	✓	✓	✓	✓
applying engineering knowledge, understanding and skills in a range of contexts		✓	✓	✓
ability to plan, manage and implement a challenging engineering project	✓			✓

# Approaches to learning and teaching

Advanced Higher Courses place more demands on learners as there will be a higher proportion of independent study and less direct supervision. Some of the approaches to learning and teaching suggested for other levels (in particular, Higher) may also apply at Advanced Higher level but there will be a stronger emphasis on independent learning.

For Advanced Higher Courses, a significant amount of learning may be self-directed and require learners to demonstrate a more mature approach to learning and the ability to work on their own initiative. This can be very challenging for some learners, who may feel isolated at times, and teachers and lecturers should have strategies for addressing this. These could include, for example, planning time for regular feedback sessions/discussions on a one-to-one basis and on a group basis led by the teacher or lecturer (where appropriate).

Teachers and lecturers should encourage learners to use an enquiring, critical and problem-solving approach to their learning. Learners should also be given the opportunity to practise and develop research and investigation skills and higher-order evaluation and analytical skills. The use of Information and Communications Technology (ICT) can make a significant contribution to the development of these higher-order skills as research and investigation activities become more sophisticated.

Learners will engage in a variety of learning activities as appropriate to the subject, for example:

- ◆ researching information for their subject rather than receiving information from their teacher or lecturer
- ◆ using active and open-ended learning activities such as research, case studies and presentation tasks
- ◆ making use of the internet to draw conclusions about specific issues
- ◆ recording in a systematic way the results of research and independent investigation from different sources
- ◆ presenting findings/conclusions of research and investigation activities in a presentation
- ◆ participating in group work with peers and using collaborative learning opportunities to develop team working
- ◆ drawing conclusions from complex information
- ◆ using appropriate technological resources (eg web-based resources)
- ◆ participating in field trips and visits

Teachers and lecturers should support learners by having regular discussions with them and giving regular feedback. Some learning and teaching activities may be carried out on a group basis and, where this applies, learners could also receive feedback from their peers.

Teachers and lecturers should, where possible, provide opportunities to personalise learning and enable learners to have choices in approaches to learning and teaching. The flexibility in Advanced Higher Courses and the independence with which learners carry out the work lend themselves to this. In particular, in this Course learners have opportunities to:

- ◆ select and investigate a real-world engineering project in the Engineering Project Management Unit
- ◆ research aspects of engineering of interest to themselves in both the Electronics and Control and Mechanisms and Structures Units
- ◆ plan, manage and implement a challenging engineering project on a topic they have chosen, for their Course assessment

Teachers and lecturers should also create opportunities for, and use, inclusive approaches to learning and teaching. This can be achieved by encouraging the use of a variety of learning and teaching strategies that suit the needs of all learners. Innovative and creative ways of using technology can also be valuable in creating inclusive learning and teaching approaches.

Centres are free to sequence the teaching of the Outcomes, Units and/or Course in any order they wish. For example:

- ◆ Each Unit could be delivered separately in any sequence.

**or**

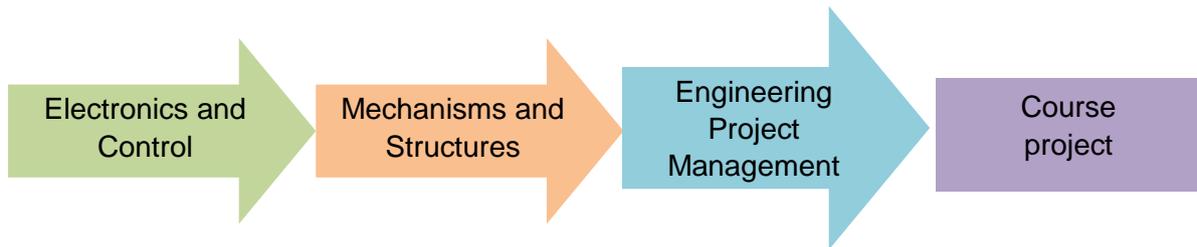

- ◆ The Units may be delivered in a combined way as part of the Course. If this approach is used, the Outcomes within Units may either be partially or fully combined.

The project assesses application of knowledge, understanding and skills developed through the other Units, so it will normally be delivered towards the end of the Course. However, it may be possible to begin work on the project at an earlier stage, but only where it is clear that learners have already gained the required skills and knowledge.

*Mechanisms and Structures*, and *Electronics and Control*, can be taught in either order, or in parallel. This provides flexibility for centres, regarding access to equipment, as this may need to be shared with other groups.

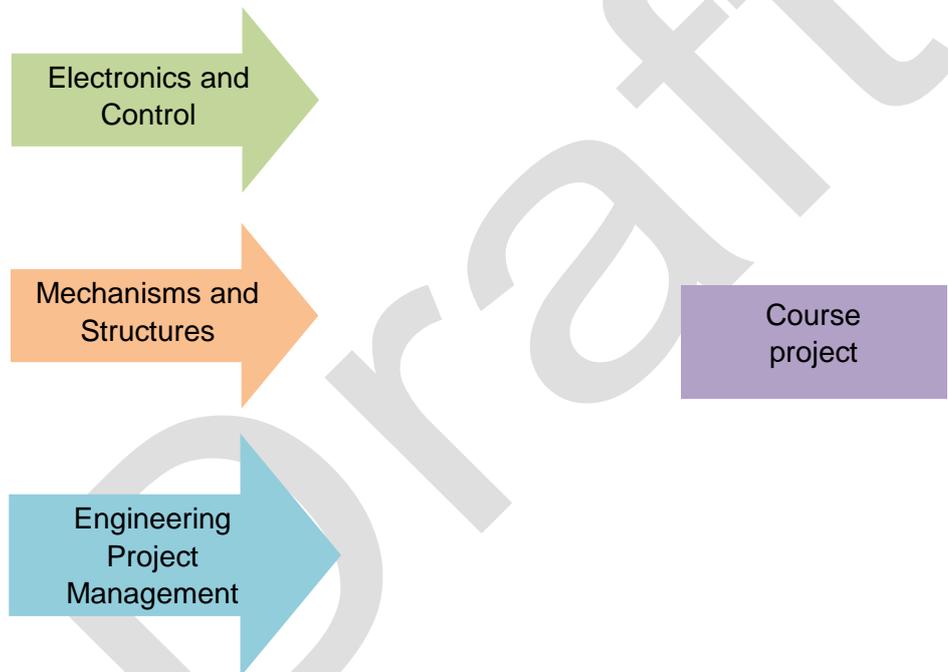

Taking all of the above into account, the following example Course structures might be considered.

**Example 1: Sequential delivery of the Units, with *Engineering Project Management* as the final Unit, leading on to the Course project**

The rationale for this delivery model is that the project will be based on planning and research carried out during the *Project Management* Unit, and knowledge and understanding developed in the *Electronics and Control*, and *Mechanisms and Structures*, Units.

**Example 2: Concurrent delivery of Units**

In this example, the three Units are studied concurrently, leading up to the final project. Combinations or hybrids of these two examples are also possible.

There may be opportunities to contextualise approaches to learning and teaching to Scottish contexts in this Course. This could be done through mini-projects or case studies.

# Developing skills for learning, skills for life and skills for work

The following skills for learning, skills for life and skills for work should be developed in this Course.

## **2 Numeracy**

- 2.1 Number processes
- 2.3 Information handling

## **3 Health and wellbeing**

- 3.1 Personal learning

## **4 Employability, enterprise and citizenship**

- 4.1 Employability
- 4.2 Information and communication technology (ICT)

## **5 Thinking skills**

- 5.3 Applying
- 5.4 Analysing and evaluating
- 5.5 Creating

Teachers and lecturers should ensure that learners have opportunities to develop these skills as an integral part of their learning experience.

It is important that learners are aware of the skills for learning, skills for life and skills for work that they are developing in the Course and the activities they are involved in that provide realistic opportunities to practise and/or improve them.

At Advanced Higher level it is expected that learners will be using a range of higher-order thinking skills. They will also develop skills in independent and autonomous learning.

# Approaches to assessment

Assessment in Advanced Higher Courses will generally reflect the investigative nature of Courses at this level, together with high-level problem-solving and critical thinking skills and skills of analysis and synthesis.

This emphasis on higher-order skills, together with the more independent learning approaches that learners will use, distinguishes the added value at Advanced Higher level from the added value at other levels.

There are different approaches to assessment, and teachers and lecturers should use their professional judgement, subject knowledge and experience, as well as their understanding of their learners and their varying needs, to determine the most appropriate approaches and, where necessary, to consider workable alternatives.

Assessments must be fit for purpose and should allow for consistent judgements to be made by all teachers and lecturers. They should also be conducted in a supervised manner to ensure that the evidence provided is valid and reliable.

## Unit assessment

Assessments must ensure that the evidence generated demonstrates, at the least, the minimum level of competence for each Unit. Teachers and lecturers preparing assessment methods should be clear about what that evidence will look like.

Sources of evidence likely to be suitable for Advanced Higher Units could include:

- ◆ exemplification of concepts by creating and interpreting diagrams and carrying out mathematical processes
- ◆ interpretation of numerical data in both practical and theoretical contexts
- ◆ practical activities involving simulation, construction and testing of engineered systems
- ◆ reports on investigations

Evidence should include the use of appropriate subject-specific terminology as well as the use of real-life examples where appropriate.

Flexibility in the method of assessment provides opportunities for learners to demonstrate attainment in a variety of ways and so reduce barriers to attainment.

The structure of an assessment used by a centre can take a variety of forms, for example:

- ◆ individual pieces of work could be collected in a folio as evidence for Outcomes and Assessment Standards

- ◆ assessment of each complete Outcome
- ◆ assessment that combines the Outcomes of one or more Units
- ◆ assessment that requires more than the minimum competence, which would allow learners to prepare for the Course assessment

Teachers and lecturers should note that learners' day-to-day work may produce evidence that satisfies the assessment requirements of a Unit, or Units, either in full or partially. Such naturally-occurring evidence may be used as a contribution towards Unit assessment. However, this naturally occurring evidence must still be recorded and evidence such as written reports, recording forms, PowerPoint slides, drawings/graphs, video footage or observational checklists provided.

## Combining assessment across Units

Units will be assessed on a pass/fail basis. All Units are internally assessed against the requirements shown in the *Unit Specification*. Each Unit can be assessed on an individual Outcome-by-Outcome basis or via the use of combined assessment for some or all Outcomes.

Care must be taken to ensure that combined assessments provide appropriate evidence for all the Outcomes that they claim to assess. When combining assessments across Units, teachers/lecturers should use e-assessment wherever possible. Learners can easily update portfolios, electronic or written diaries and recording sheets.

For some Advanced Higher Courses, it may be that a strand of work that contributes to a Course assessment method is started when a Unit is being delivered and is completed in the Course assessment. In these cases, it is important that the evidence for the Unit assessment is clearly distinguishable from that required for the Course assessment. For example, the design proposal and plan required for Outcome 2 of the *Engineering Project Management* Unit is likely to be taken forward and developed by a learner into the Course project.

## Preparation for Course assessment

Each Course has additional time that may be used at the discretion of the teacher or lecturer to enable learners to prepare for Course assessment. This time may be used near the start of the Course and at various points throughout the Course for consolidation and support. It may also be used for preparation for Unit assessment, and, towards the end of the Course, for further integration, revision and preparation and/or gathering evidence for Course assessment.

For this Course, the assessment methods are a project and a question paper. Learners should be given opportunities to practise these methods and prepare for them.

Examples of activities to include within this preparation time include:

- ◆ Preparing for the Components of Course assessment, for example:
  - preparing for the project: selecting a topic, gathering and researching information, evaluating and analysing findings, developing and justifying conclusions, presenting the information
  - practising and refining practical skills
  - practising question paper techniques, and revising for the question paper

In relation to preparing for the project, teachers and lecturers should explain requirements to learners and the amount and nature of the support they can expect. However, at Advanced Higher level it is expected that learners will work with more independence and less supervision and support.

## Authenticity

In terms of authenticity, there are a number of techniques and strategies to ensure that learners present work that is their own. Teachers and lecturers should put in place mechanisms to authenticate learner evidence.

For example:

- ◆ regular checkpoint/progress meetings with learners
- ◆ short spot-check personal interviews
- ◆ checklists that record activity/progress
- ◆ photographs, films or audio records

Group work approaches are acceptable as part of the preparation for assessment and also for formal assessment. However, there must be clear evidence for each learner to show that they have met the Evidence Requirements.

For more information, please refer to SQA's *Guide to Assessment*.

## Added value

Advanced Higher Courses include assessment of added value, which is assessed in the Course assessment.

Information given in the *Course Specification* and the *Course Assessment Specification* about the assessment of added value is mandatory.

In Advanced Higher Courses, added value involves the assessment of higher-order skills such as high-level and more sophisticated investigation and research skills, critical thinking skills and skills of analysis and synthesis. Learners may be required to analyse and reflect upon their assessment activity by commenting on it and/or drawing conclusions with commentary/justification. These skills contribute to the uniqueness of Advanced Higher Courses and to the overall higher level of performance expected at this level.

In this Course, added value will be assessed by means of a project and a question paper.

The question paper is used to assess whether the learner can retain and consolidate the knowledge and skills gained in individual Units. It assesses knowledge and understanding and the various different applications of knowledge such as reasoning, analysing, evaluating and solving problems.

The project is used to assess a wide range of high-order cognitive and practical skills and to integrate assessment. The project brings a number of higher-order skills together, such as skills relating to planning, analysis, synthesis, evaluation and report-writing. The learner will carry out a significant part of the work for the project independently with minimal supervision.

Draft

# Equality and inclusion

It is recognised that centres have their own duties under equality and other legislation and policy initiatives. The guidance given in these *Course/Unit Support Notes* is designed to sit alongside these duties but is specific to the delivery and assessment of the Course.

It is important that centres are aware of and understand SQA's assessment arrangements for disabled learners, and those with additional support needs, when making requests for adjustments to published assessment arrangements. Centres will find more guidance on this in the series of publications on Assessment Arrangements on SQA's website: [www.sqa.org.uk/sqa/14977.html](http://www.sqa.org.uk/sqa/14977.html).

The greater flexibility and choice in Advanced Higher Courses provide opportunities to meet a range of learners' needs and may remove the need for learners to have assessment arrangements. However, where a disabled learner needs a reasonable adjustment/assessment arrangements to be made, you should refer to the guidance given in the above link.

# Appendix 1: Further information on Units in the Course

## Engineering Project Management (Advanced Higher)

It is strongly recommended that if this Unit is being delivered as part of the Advanced Higher Engineering Science Course, it should be delivered last, or concurrently with the other Units. This would allow learning from the other Units to be integrated and consolidated within engineering contexts. If being delivered as a stand-alone Unit, then every opportunity should be taken to allow learners to apply and integrate technological knowledge and skills from previous learning.

### Notes on delivery of Outcome 1

The key word for this Outcome is 'investigate'. Teachers should encourage each learner to embark on their own independent research, providing support and guidance as required.

When investigating project development and management, learners may consider aspects of resource management, time management, cost allocation management, product life cycle planning and critical path analysis.

### Notes on delivery of Outcome 2

Learners will need clear guidance on the suitability of their chosen engineering problem, to ensure it is both suitably challenging but realistically possible within time and resource constraints, especially if the learner intends to take the design proposal forward and implement a solution for the Course assessment.

Learners may need teacher input on developing a design proposal and project planning. The project plan could be done using critical path analysis and an activity-on-node diagram constructed showing each of the activities required to complete the proposal, the time required and the dependencies between them.

## Electronics and Control (Advanced Higher)

### Notes on delivery of Outcome 1

Possible learning activities that would meet the Unit standards and cover the mandatory Course concepts could include:

- ◆ analysing circuits using nodal analysis by
  - labelling all circuit parameters and distinguishing unknown from known
  - identifying all nodes of the circuit
  - selecting a node as the ground node and giving it a potential of 0 V; all other voltages in the circuit are measured with respect to the ground node.
  - labelling the voltages and polarities at all other nodes

- applying Kirchhoff's Current Law at each node and expressing the branch currents in terms of the node voltages
- solving the resulting two simultaneous equations for the node voltages
- now that the node voltages are known, the branch currents may be obtained using Ohm's law
- ◆ designing transistor biasing circuits for a given output load
- ◆ calculating the switch on and switch off threshold values for a Schmitt trigger or an unknown resistor value if given one of the thresholds and sketching a hysteresis curve of the output a Schmitt trigger showing the threshold voltages
- ◆ investigating and calculating values for a basic integrating op-amp used as a ramp generator.
- ◆ calculating the frequency of a Wien bridge oscillator using the expression  $f=1/(2\pi RC)$
- ◆ designing a suitable 555 timer circuit with a single unknown using the expression  $f= 1.44 / (R_1 + 2R_2) C$
- ◆ studying the principles and applications of A-D and D-A conversion
- ◆ investigating the basic principles of power generation, for example:
  - drawing a single line schematic of the electricity supply system that includes interconnected generators, transmission system, distribution system, industrial and low voltage loads, relevant transformers and small scale generation; the schematic should show at least two feeders in all systems to allow for duality of supply and one spur feeder and should be annotated with relevant voltage levels
  - explaining the function of each item of apparatus in the electricity supply system and the requirement of alternative feed routes
  - describing at least four energy sources and listing typical ratings for each explaining load matching
- ◆ developing high level language programs (possibly using C) to solve control problems involving multiple inputs and outputs, and proportional control
- ◆ creating programs that include input, output, branching, loops (fixed, continuous, nested), time delays, logic and arithmetical operations, subroutines

Wherever possible, practical activities should be used to develop understanding.

### **Notes on delivery of Outcome 2**

Learners should choose a topic or application within the broad areas of electronic, electrical or control engineering, carry out some internet-based research, and apply their findings by simulating or constructing a circuit or model.

# Mechanisms and Structures (Advanced Higher)

## Notes on delivery of Outcome 1

Possible learning activities that would meet the Unit standards and cover the mandatory Course concepts could include:

- ◆ analysis and calculation of forces and torque within drive systems, for example using Hooke's law as a workable approximation to determine the shear stress in a member with a torque applied to it (assuming a uniform shear stress in the member the shear force can then be calculated)
- ◆ using tables of data to select materials and standard sections, to meet a given requirement for a simple beam design; calculations can then be carried out to investigate a loaded beam using the general bending equation
- ◆ use of equations of equilibrium in a beam with type 1 and type 2 support
- ◆ applying the conditions of static equilibrium to complex structural systems, and carrying out calculations to determine the magnitude and direction of support reactions
- ◆ beam analysis (for forces acting in 3 dimensions, by resolving into 2 orthogonal planes)
- ◆ free body diagram for a beam under the action of gear or pulley forces
- ◆ investigating complex plane triangulated frames using the method of sections to determine the magnitude and nature of the internal forces in the members
- ◆ evaluation of the distribution of shear force and bending moment for loaded beams, by using free body diagrams and calculations to determine the magnitude of support reactions; the shear force and bending moment applied to loaded beams can then be investigated and diagrams drawn up

## Notes on delivery of Outcome 2

Learners should choose a topic or application within the broad areas of mechanical, structural or civil engineering, carry out some internet-based research, and apply their findings by simulating or constructing a model.

## Comparison of Higher and Advanced Higher

This table shows the relationship between the mandatory Higher and Advanced Higher knowledge and understanding. This table may be useful for:

- ◆ ensuring seamless progression between levels
- ◆ identifying important prior learning for learners at Advanced Higher

Teachers should also refer to the Outcomes and Assessment Standards for each level when planning delivery.

Course themes		
Topic	Higher	Advanced Higher
The systems approach	<p>complex system, sub-system and control diagrams</p> <p>the role of feedback in a system</p> <p>closed loop, two-state and proportional feedback</p> <p>use of error detection in a closed loop system</p>	<p>use of system, sub-system and control diagrams to analyse complex engineering systems, including time- and event-based systems</p>
