# National 5 Computing Science Course Specification (C716 75)

**Valid from August 2013**

First edition: April 2012  
Revised: June 2013, version 1.1

This specification may be reproduced in whole or in part for educational purposes provided that no profit is derived from reproduction and that, if reproduced in part, the source is acknowledged. Additional copies of this Course Specification can be downloaded from SQA's website: [www.sqa.org.uk](http://www.sqa.org.uk).

Please refer to the note of changes at the end of this Course Specification for details of changes from previous version (where applicable).

## Course outline

**Course title:** National 5 Computing Science

**SCQF:** level 5 (24 SCQF credit points)

**Course code:** C716 75

### Mandatory Units

<b>H223 75</b>	<b>Software Design and Development (National 5)</b>	<b>9 SCQF credit points</b>
<b>H226 75</b>	<b>Information System Design and Development (National 5)</b>	<b>9 SCQF credit points</b>

**Course assessment** **6 SCQF credit points**

This Course includes six SCQF credit points to allow additional time for preparation for Course assessment. The Course assessment covers the added value of the Course. Further information on the Course assessment is provided in the Assessment section.

### Recommended entry

Entry to this Course is at the discretion of the centre. However, learners would normally be expected to have attained the skills, knowledge and understanding required by the following or equivalent qualifications and/or experience:

- ◆ National 4 Computing Science Course or relevant Units
- ◆ Numeracy (National 4) Unit

In terms of prior learning and experience, relevant experiences and outcomes may also provide an appropriate basis for doing this Course.

### Core Skills

Achievement of this Course gives automatic certification of the following:

Complete Core Skill                      Information and Communication Technology at SCQF level 5

### Progression

This Course or its components may provide progression to

- ◆ other qualifications in Computing Science or related areas
- ◆ further study, employment and/or training

Further details are provided in the Rationale section.

## **Equality and inclusion**

This Course Specification has been designed to ensure that there are no unnecessary barriers to learning or assessment. The individual needs of learners should be taken into account when planning learning experiences, selecting assessment methods or considering alternative evidence. For further information, please refer to the *Course Support Notes*.

## **Rationale**

All new and revised National Courses reflect Curriculum for Excellence values, purposes and principles. They offer flexibility, provide more time for learning, more focus on skills and applying learning, and scope for personalisation and choice.

In this Course, and its component Units, there will be an emphasis on skills development and the application of those skills. Assessment approaches will be proportionate, fit for purpose and will promote best practice, enabling learners to achieve the highest standards they can.

This Course provides learners with opportunities to continue to acquire and develop the attributes and capabilities of the four capacities as well as skills for learning, skills for life and skills for work.

All Courses provide opportunities for learners to develop breadth, challenge and application, but the focus and balance of the assessment will be appropriate for the subject area.

## **Relationship between the Course and Curriculum for Excellence values, purposes and principles**

The Course provides an understanding of the technologies that underpin our modern, digital world and develops transferrable skills. It brings together elements of technology, science and creative digital media and has wide-ranging social implications, providing an excellent opportunity for cross-curricular learning in the senior phase.

At this level, the Course will cover a common core of concepts which underpin the study of computing science, and explore the role and impact of contemporary computing technologies, providing an insight into the challenge, excitement and reward to be found in these areas.

The Course encourages learners to become successful, responsible and creative and to continue to acquire and develop the attributes and capabilities of the four capacities, including: creativity, flexibility and adaptability; enthusiasm and a willingness to learn; perseverance, independence and resilience; responsibility and reliability; and confidence and enterprise.

The Course provides progression from National 4 Computing Science Course and the relevant experiences and outcomes.

## **Purpose and aims of the Course**

Computing science is vital to everyday life — socially, technologically and economically; it shapes the world in which we live and its future. Computing is embedded in the world around us, from systems and devices in our homes and places of work, to how we access education, entertainment, transportation and communication. Understanding computational processes and thinking is also vital to many other fields including science, economics, business and industry. While many learners will want to become computing professionals, all will benefit from the development of these foundational skills and the underpinning knowledge necessary to meet the needs of society today and for the future.

The aims of the Course are to enable learners to:

- ◆ develop computational thinking skills across a range of contemporary contexts
- ◆ develop knowledge and understanding of key concepts and processes in computing science
- ◆ apply skills and knowledge in analysis, design, implementation and evaluation to a range of digital solutions
- ◆ communicate computing concepts and explain computational behaviour clearly and concisely using appropriate terminology
- ◆ develop an understanding of the role and impact of computing science in changing and influencing our environment and society

Related to these aims, and underlying the study of computing science, are a number of unifying themes, including technological progress and trends, the relationship between software, hardware and system performance, and information representation and transfer as a core component of any computation. These are used to explore a variety of specialist areas through practical and investigative tasks.

## **Information about typical learners who might do the Course**

The Course is designed to be of value to all learners, especially those considering further study or a career in computing science and related disciplines. It provides sufficient breadth, flexibility, personalisation and choice to meet the needs of all learners.

Learners will develop an appreciation of the central role of computation in the modern world and gain an understanding at a high level of the many functions of computing systems, concepts and processes. They will gain an insight into the capacities of computing professionals as problem-solvers and designers, able to design, implement and operate hardware and software systems, and the far-reaching impact of information technology on our environment and society. They will also develop a range of transferable skills for learning, skills for life and skills for work, opening up a wide range of career and study opportunities and enabling them to develop as global citizens who can contribute effectively to their communities, society and the world.

On completing the Course, learners will have developed their skills in analysis and problem-solving, software and information system design, development, implementation and testing.

Course activities also provide opportunities for learners to enhance generic and transferable skills in planning and organising, working independently and in teams,

critical thinking and decision making, research, communication and self-and peer-evaluation, in a range of contexts.

# Course structure and conditions of award

## Course structure

The Course enables learners to develop a range of computing and computational thinking skills, including skills in analysis and problem-solving, design and modelling, developing, implementing and testing digital solutions, across a range of contemporary contexts.

The Course also enables learners to develop knowledge and understanding of key computing concepts and processes, and the ability to apply this to a variety of problems; and an awareness of different software development languages and environments and the legal and environmental impact of computing technologies.

Units are statements of standards for assessment and not programmes of learning and teaching. They can be delivered in a number of ways.

In addition to the Course assessment, the Course includes two mandatory Units. Each of these Units is designed to provide progression from the related Unit at National 4, and to the related Unit at Higher.

### Software Design and Development (National 5)

The aim of this Unit is for the learner to develop knowledge, understanding and practical problem-solving skills in software design and development through appropriate software development environments. Learners will develop their programming and computational thinking skills by implementing practical solutions and explaining how these programs work. These tasks will involve some complex features and both familiar and new contexts, which will require some interpretation on the part of the learner. Learners will also develop an understanding of how data and instructions are stored in binary form, basic computer architecture and awareness of different contemporary software development languages/environments.

### Information System Design and Development (National 5)

The aim of this Unit is for the learner to develop knowledge, understanding and practical problem-solving skills related to information system design and development through a range of practical and investigative tasks. Learners will apply computational thinking skills to implement practical solutions using a range of development tools and to develop an understanding of the technical, legal and environmental issues related to one or more information systems. Tasks will involve some complex features and familiar and new contexts, which will require some interpretation on the part of the learner.

## Conditions of award

To gain the award of the Course, the learner must pass all of the Units as well as the Course assessment. The required Units are shown in the Course outline section. Course assessment will provide the basis for grading attainment in the Course award.

## Skills, knowledge and understanding

Further information on the assessment of the skills, knowledge and understanding for the Course is given in the *Course Assessment Specification*. A broad overview of the

mandatory subject skills, knowledge and understanding that will be assessed in the Course is given in this section. This includes:

- ◆ applying aspects of computational thinking across a range of contexts
- ◆ analysing problems within computing science across a range of contemporary contexts
- ◆ designing, implementing and testing digital solutions (including computer programs) to problems across a range of contemporary contexts
- ◆ developing skills in computer programming and the ability to communicate how a program works by being able to read and interpret code
- ◆ communicating understanding of key concepts related to software design and development and information system design and development, clearly and concisely, using appropriate terminology
- ◆ understanding of the legal implications and environmental impact of contemporary information system technologies
- ◆ applying computing science concepts and techniques to create solutions across a range of contexts

Skills, knowledge and understanding to be included in the Course will be appropriate to the SCQF level of the Course. The SCQF level descriptors give further information on characteristics and expected performance at each SCQF level ([www.sqa.org.uk/scqf](http://www.sqa.org.uk/scqf)).

# Assessment

Information about assessment for the Course is included in the *Course Assessment Specification*, which provides full details including advice on how a learner's overall attainment for the Course will be determined.

## Unit assessment

All Units are internally assessed against the requirements shown in the *Unit Specification*.

They can be assessed on an individual Unit basis or by using other approaches which combine the assessment for more than one Unit.

They will be assessed on a pass/fail basis within centres. SQA will provide rigorous external quality assurance, including external verification, to ensure assessment judgments are consistent and meet national standards.

The assessment of the Units in this Course will be as follows.

### Software Design and Development (National 5)

For this Unit, the learner will be required to provide evidence of:

- ◆ skills in software design and development
- ◆ knowledge and understanding of software design and development
- ◆ comparing two software development languages or environments

### Information System Design and Development (National 5)

For this Unit, the learner will be required to provide evidence of:

- ◆ skills in information system design and development
- ◆ knowledge and understanding of information system design and development
- ◆ understanding of the legal implications and environmental impact of designing and implementing an information system

## Course assessment

Courses from National 4 to Advanced Higher include assessment of [added value](#)<sup>1</sup>. At National 5, Higher and Advanced Higher, the added value will be assessed in the Course assessment. The added value for the Course will address the key purposes and aims of the Course as defined in the Course Rationale. It will do this by addressing one or more of breadth, challenge or application.

In the National 5 Computing Science Course, added value will focus on:

- ◆ breadth
- ◆ challenge
- ◆ application

---

<sup>1</sup> Definitions can be found here: [www.sqa.org.uk/sqa/58409.html](http://www.sqa.org.uk/sqa/58409.html)

The learner will draw on, extend and apply the skills and knowledge they have developed during the Course. These will be assessed through a combination of an [assignment](#) and a [question paper](#)<sup>2</sup>.

The Computing Science assignment adds value by requiring challenge and application. Learners will apply knowledge and skills from both Units to solve an appropriately challenging computing science problem.

The question paper introduces breadth to the assessment. It requires depth of understanding and application of knowledge from the Units.

---

<sup>2</sup> Definitions can be found here: [www.sqa.org.uk/sqa/58409.html](http://www.sqa.org.uk/sqa/58409.html)

# Development of skills for learning, skills for life and skills for work

It is expected that learners will develop broad, generic skills through this Course. The skills that learners will be expected to improve on and develop through the Course are based on SQA's *Skills Framework: Skills for Learning, Skills for Life and Skills for Work* and drawn from the main skills areas listed below. These must be built into the Course where there are appropriate opportunities.

## **2 Numeracy**

- 2.1 Number processes
- 2.3 Information handling

## **4 Employability, enterprise and citizenship**

- 4.2 Information and communication technology (ICT)

## **5 Thinking skills**

- 5.3 Applying
- 5.4 Analysing and evaluating

Amplification of these skills is given in SQA's *Skills Framework: Skills for Learning, Skills for Life and Skills for Work*. The level of these skills will be appropriate to the level of the Course. Further information on building in skills for learning, skills for life and skills for work for the Course is given in the *Course Support Notes*.

Employability, enterprise and citizenship skills shown in this National Course provide automatic certification of Core Skill: Information and Communication Technology at SCQF level 5.
