

## **National Unit Specification**

#### **General information**

**Unit title:** Data Science Project (SCQF level 5)

Unit code: J2GT 45

Superclass: CB

Publication date: June 2019

**Source:** Scottish Qualifications Authority

Version: 02, August 2019

### **Unit purpose**

The purpose of this unit is to allow learners to complete an end-to-end data science project within a team, using pre-existing knowledge and skills.

This capstone project will introduce the types of routine problems that can be solved using data science techniques, reinforce the learner's knowledge of data science and provide a meaningful opportunity to apply data science tools and techniques. It will also provide an opportunity for learners to demonstrate the 'soft skills' that are important in a real-world workplace, such as team work, collaboration, good time management, problem-solving and effective communication skills.

The unit is a **non-specialist** unit. Learner will require basic knowledge of the data science process, which could be evidenced by possession of J2G3 45 *Data Science* at SCQF level 5.

On completion of this unit, learners will have undertaken a complete data science project within a **group** context. The activities include: identifying the problem in a project brief, analysing the collected data and communicating the results. The focus of the unit is on clarity and communication throughout each of the steps rather than the level of analysis delivered.

Learners may progress to more advanced units in this field such as J2G4 46 *Data Science* at SCQF level 6, where the expected level of analysis is more stringent, and subsequently to J2GV 46 *Data Science: Project* at SCQF level 6, when they will undertake an independent project.

## **National Unit Specification: General information (cont)**

**Unit title:** Data Science Project (SCQF level 5)

#### **Outcomes**

On successful completion of the unit the learner will be able to:

- 1 Develop a project plan within a group context.
- 2 Collect data safely and securely.
- 3 Analyse the collected data to extract insights.
- 4 Communicate the analysis findings.

### Credit points and level

1 National Unit credit at SCQF level 5 (6 SCQF credit points at SCQF level 5)

### Recommended entry to the unit

Whilst entry is at discretion of the centre, learners should possess basic knowledge of the data science process and skills in its application to small datasets, which could be evidenced by possession of J2G3 45 *Data Science* at SCQF level 5 and J2HP 45 *Data Citizenship* at SCQF level 5.

### **Core Skills**

Achievement of this Unit gives automatic certification of the following:

Complete Core Skill Problem Solving at SCQF level 4

Opportunities to develop aspects of Core Skills are highlighted in the Support Notes for this Unit specification.

# **Context for delivery**

If this unit is delivered as part of a group award, it is recommended that it should be taught and assessed within the subject area of the group award to which it contributes. For example, if this unit is delivered as part of the National Progression Award in Data Science at SCQF level 5, it should be delivered after the two mandatory units (*Data Science* and *Data Citizenship*) to permit learners to acquire the necessary knowledge and skills to attempt this unit.

# **Equality and inclusion**

This unit specification has been designed to ensure that there are no unnecessary barriers to learning or assessment. The individual needs of learners should be taken into account when planning learning experiences, selecting assessment methods or considering alternative evidence.

Further advice can be found on our website www.sqa.org.uk/assessmentarrangements.

## **National Unit Specification: Statement of standards**

**Unit title:** Data Science Project (SCQF level 5)

Acceptable performance in this unit will be the satisfactory achievement of the standards set out in this part of the unit specification. All sections of the statement of standards are mandatory and cannot be altered without reference to SQA.

Where evidence for outcomes is assessed on a sample basis, the whole of the content listed in the knowledge and/or skills section must be taught and available for assessment. Learners should not know in advance the items on which they will be assessed and different items should be sampled on each assessment occasion.

### **Outcome 1**

Develop a project plan within a group context.

#### Performance criteria

- (a) Identify the problem being addressed in a project brief
- (b) Describe the background to the problem
- (c) Describe the potential benefits of solving the problem
- (d) Create a plan of activities for each role assigned within the group

#### **Outcome 2**

Collect data safely and securely.

#### Performance criteria

- (a) Identify the data, and appropriate data sources, required for the analysis
- (b) Assemble the required dataset
- (c) Employ secure methods for storing the data
- (d) Recognise legal and privacy considerations with the required data
- (e) Identify data quality issues
- (f) Identify sources of bias in the data

### **Outcome 3**

Analyse the collected data to extract insights.

#### Performance criteria

- (a) Prepare and pre-process data for analysis
- (b) Calculate dataset summary metrics
- (c) Interpret analysis to identify insights
- (d) Create graphs to visualise insights

## **National Unit Specification: Statement of standards (cont)**

**Unit title:** Data Science Project (SCQF level 5)

#### **Outcome 4**

Communicate the analysis findings.

#### Performance criteria

- (a) Interpret insights to create conclusions
- (b) Identify future actions required
- (c) Present the analysis findings to a wider audience
- (d) Summarise learning from the project

### **Evidence requirements for this unit**

Learners will need to provide evidence to demonstrate the performance criteria across all outcomes. The evidence requirements for this unit will take **one** form: product evidence.

The **product evidence** will relate to all outcomes. It will be produced by a **group**, comprising at least two learners. The product evidence will take the form of a **portfolio**. There is no requirement for the evidence to be duplicated by each member of the group. A single copy of the portfolio is sufficient.

The team portfolio must contain the following items.

- 1 **Problem statement**, which identifies the problem in a project brief and describes both the background to the problem and the benefits of solving it.
- 2 Project plan broken down by team roles and activities.
- 3 **Summary of the dataset** required, collection method and storage approach.
- 4 **Analysis** of the dataset, including the steps taken and output of the analysis, with appropriate visualisations.
- 5 **Summary of key findings** from the analysis to be presented to a wider audience.

Although learners may lead on specific aspects of the project, such as playing a lead role in the creation of the project plan, every member of the group must contribute to the creation of each item of evidence.

The portfolio should be assessed holistically (on a pass/fail basis) but each learner should be assessed individually, based on their individual contributions, which may differ from the holistic assessment.

The scale and complexity of the problem should be consistent with the SCQF level of this unit (level 5), and involve the analysis of a dataset comprising at least 1,000 multi-variate records. The project must elicit evidence from learners that covers the key knowledge and skills in J2G3 45 *Data Science* at SCQF level 5.

### **National Unit Specification: Statement of standards (cont)**

**Unit title:** Data Science Project (SCQF level 5)

The following level descriptors are particularly relevant to the evidence.

- Demonstrate and/or work with knowledge and understanding of basic processes, materials and terminology.
- Relate knowledge and ideas to practical contexts.
- Use a range of skills associated with the subject to complete some routine tasks.
- Plan and organise both familiar and unfamiliar tasks.
- Select appropriate tools and materials and use them safely and effectively.
- Produce and respond to detailed written and oral communication in familiar contexts.
- Work with others on tasks with minimum directive supervision.
- Agree goals and responsibilities for self and work team.
- Take lead responsibility for some tasks.
- Show an awareness of own and/or others' roles, responsibilities and requirements in carrying out work and contribute to the evaluation and improvement of practices and processes.

Whenever possible, evidence should be a naturally occurring by-product of teaching and learning. This evidence may be produced independently over the life of the unit, under loosely controlled conditions (including access to reference materials). Authentication will be necessary. The guide to assessment provides further advice on methods of authentication.

The guidelines on approaches to assessment (see the support notes section of this specification) provides specific examples of instruments of assessment.

## **National Unit Support Notes**

**Unit title:** Data Science Project (SCQF level 5)

Unit support notes are offered as guidance and are not mandatory.

While the exact time allocated to this unit is at the discretion of the centre, the notional design length is 40 hours.

#### Guidance on the content and context for this unit

This unit is an optional unit within the NPA Data Science at SCQF level 5. It is intended to give learners the opportunity to use the skills, knowledge and understanding developed through the successful completion of the core units within the award. It is recommended that this unit be delivered towards the end of the programme of study, when learners are in a position to demonstrate the knowledge and skills they have accumulated over the programme.

The general context for this unit is the rising use of data science, and its vocational relevance to an increasing number of occupations and professions. The unit is intended for non-specialists and may be offered as part of a wide range of programmes. No prior knowledge of computer science or statistics is required; however, numerical competency is presumed.

The unit aims to enable the learner within a group context to complete an end-to-end data science project from producing a problem statement to delivering value. This value can come from either an implemented solution or insight that drives a different decision or approach. The focus of the unit is on completing the steps required for a successful data science project, with the outcomes aligned to these required steps. The learner is guided by these outcomes to demonstrate an understanding of the problem they are addressing and develop an approach to addressing it. Of lesser focus is the complexity of the analysis undertaken, although it is important to use analysis to develop solutions and communicate these. It is recommended to carry out the project in groups of two to four learners.

Please note that the following guidance, relating to specific outcomes, does not seek to explain each performance criterion, which is left to the professionalism of the teacher. It seeks to clarify the statement of standards where it is potentially ambiguous. It also focuses on non-apparent teaching and learning issues that may be over-looked, or not emphasised, during unit delivery. As such, it is not representative of the relative importance of each outcome or performance criterion.

**Outcome 1:** This outcome demonstrates that the learner fully understands the problem they are attempting to address and has a group plan to achieve this. By investigating the background to the problem and identifying the benefits, this will allow the learner to align their analysis effort to the problem as a whole.

There is almost a limitless set of possibilities to what data can be used for: it could be to answer an interesting question, it could be to do something useful, or it could be to create something valuable. The best data projects aim to address all three areas.

**Unit title:** Data Science Project (SCQF level 5)

The kinds of questions that can be turned into data problems are:

- How much or how many?
- Which category
- ♦ Which group?
- ♦ Is this weird?
- Which option should be taken?

A data science team consists of a number of individuals who all have a part to play in ensuring the project is a success. This outcome allows the learner to identify a role within a team. Generally there are three key roles within a data science team:

Role	Key responsibilities	Skills	
Translator	♦ Communicates the project purpose	♦ Presentations	
	<ul> <li>Designs the experiment</li> </ul>	♦ Project management	
	<ul> <li>Interprets the findings</li> </ul>	◆ Data visualisation	
	<ul> <li>Develops and manages the plan</li> </ul>		
Engineer	Collects the data	◆ Coding	
	<ul> <li>Stores the data safely</li> </ul>	◆ Database design	
	<ul> <li>Checks the data quality</li> </ul>		
	<ul> <li>Implements the solution</li> </ul>		
	<ul> <li>Automates the ongoing monitoring</li> </ul>		
Analyst	<ul> <li>Organises the data for analysis</li> </ul>	◆ Statistics	
	<ul> <li>Carries out the analysis</li> </ul>	◆ Coding	
	◆ Tests the outputs		
	<ul> <li>Summarises the findings</li> </ul>		

The plan created can be high level but should demonstrate an understanding of the areas to be addressed including research, data capture, storage, analysis methods, tools, risks and stakeholders.

The types of questions to answer at this stage are:

- What data is needed?
- ♦ Where will this data come from?
- Is there access to the data?

**Outcome 2:** This outcome demonstrates that the learner has given consideration to the actual data and sample they are using. Data can be accessed/captured from a variety of sources: existing, internet/download/open data, manually captured through surveys, technology such as wearables and sensors. It is important that learners understand the importance of these steps prior to diving into the actual analysis.

The types of questions to answer at this stage are:

- Will there be enough data to provide a robust answer?
- Will there be too much data to store easily?
- Are there any social or moral implications of collecting or using this data?
- Are there any quality issues with the data being used?

**Unit title:** Data Science Project (SCQF level 5)

**Outcome 3:** This outcome demonstrates that the learner is able to carry out the actual analysis of the data. This can be done using whatever tools the learner is most comfortable with, from spreadsheets to open source or proprietary programming languages.

A key part of the analysis phase covers the pre-processing and manipulation of raw data into usable information. The types of activities expected to be undertaken cover:

- ♦ Importing Reading the data into the chosen tool
- Tidying Restructuring the data into a tidy dataset, with observations in rows and variables in columns
- Minimising Removing the variables that are not needed for the analysis
- De-duplicating/filtering/deletion Removing unnecessary observations
- Formatting Getting the data type correct
- Removing outliers
- Merging if data is in multiple datasets

The actual analysis is expected to cover activities such as metric creation, counts and frequency distributions, descriptive statistics, cross-tabulations and scatterplots, but will be dependent on the problem statement.

**Outcomes 4:** This outcome demonstrates that the learner is able to make conclusions from the analysis and communicate the process gone through to achieve them, whilst still considering next steps. Consideration of the next steps is very important in the data science process as it provides a purpose to the project. Value can only be extracted from the project if a different decision is made, or an existing process is changed. This outcome ensures the learner reviews their insight and makes a conscious decision around what they will do with it next.

The types of questions to answer at this stage are:

- How does the data answer the original problem statement?
- What are the conclusions?
- What could be done differently next time?
- What should happen next?

# Guidance on approaches to delivery of this unit

The outcomes may be delivered in the order in which they are written. They have been written with a learning sequence in mind.

A suggested distribution of time, across the outcomes, is:

- ♦ Outcome 1: 8 hours
- ♦ Outcome 2: 6 hours
- ♦ Outcome 3: 16 hours
- ♦ Outcome 4: 10 hours

If learners are developing their own project briefs, then more time should be allowed for Outcome 1.

**Unit title:** Data Science Project (SCQF level 5)

Support may be required to ensure safe capture and storage of data and access to any tools.

Although learners may be working on different project briefs, it is expected that a class will be working on each outcome at the same time.

### Guidance on approaches to assessment of this unit

Evidence can be generated using different types of assessment. The following are suggestions only. There may be other methods that would be more suitable to learners.

Centres are reminded that prior verification of centre-devised assessments would help to ensure that the national standard is being met. Where learners experience a range of assessment methods, this helps them to develop different skills that should be transferable to work or further and higher education.

Assessment evidence is required at all stages and is expected to be in the form of a group portfolio documenting the steps, decisions taken, plans, datasets, analysis and conclusions. It is recommended that for Outcome 4 a presentation is also prepared to support the communication of findings and project steps. To authenticate individual learners' contribution to the group project, assessors may use oral questioning to make sure each learner is an active and effective team member and has made sufficient contribution to the group project. It is possible for a learner to 'fail' the unit while the team portfolio was given a 'pass' if their individual contribution did not meet the evidence requirements.

Formative assessment could be used to assess learners' knowledge at various stages throughout the life of the unit. An ideal time to gauge their knowledge would be at the end of each outcome. This assessment could be delivered through an item bank of selected response questions, providing diagnostic feedback to learners.

## **Opportunities for e-assessment**

E-assessment may be appropriate for some assessments in this unit. By e-assessment we mean assessment which is supported by Information and Communication Technology (ICT), such as e-testing or the use of e-portfolios or social software.

Centres which wish to use e-assessment must ensure that the national standard is applied to all learner evidence and that conditions of assessment as specified in the evidence requirements are met, regardless of the mode of gathering evidence. The most up-to-date guidance on the use of e-assessment to support SQA's qualifications is available at www.sqa.org.uk/e-assessment.

**Unit title:** Data Science Project (SCQF level 5)

## Opportunities for developing Core and other essential skills

In this unit the project may provide opportunities for learners to develop all five Core Skills at SCQF level 5.

#### Problem Solving:

- Critical Thinking is addressed in Outcomes 1 and 4
- Planning and Organising are addressed in Outcome 1
- Review and Evaluation are addressed in Outcome 4.

#### Communication:

- Oral Communication is addressed in Outcome 4
- Written Communication (writing) goes across the whole unit

### Numeracy:

- Using Graphical Information is addressed in Outcome 3
- Using Number is addressed in Outcomes 3 and 4

#### Information and Communication Technology:

- ♦ Accessing Information is addressed in Outcome 2
- Providing/Creating Information is addressed across the whole unit

#### Working with Others:

- Working Co-operatively with Others goes across all outcomes.
- Reviewing Co-operative Contribution is addressed in Outcome 4.

The project will also provide opportunities for learners to develop skills in planning, decision-making, implementation, time management, evaluation, enterprise, employability and citizenship. The degree to which the opportunities are exploited will depend on the realism of the project brief chosen.

This Unit has the Core Skill of Problem Solving at SCQF level 4 embedded in this unit. When a learner achieves the unit, their Core Skills profile will also be updated to include this Core Skill.

# History of changes to unit

Version	Description of change	Date
02	Core Skill Problem Solving at SCQF level 4 embedded.	16/08/19

#### General information for learners

**Unit title:** Data Science Project (SCQF level 5)

This section will help you decide whether this is the unit for you by explaining what the unit is about, what you should know or be able to do before you start, what you will need to do during the unit and opportunities for further learning and employment.

The purpose of this unit is to allow you to work as a group to complete an end-to-end data science project. This will involve deciding the problem that you will address, understanding the importance of the problem in a project brief, jointly planning how you will carry out the project, collecting and analysing the data and communicating the findings. You will document the decisions and findings as you go, to create a group portfolio that constitutes your data science project.

The unit is suitable if you have undertaken the core units for the NPA Data Science (SCQF level 5) and will give you an opportunity to practise the skills and techniques you have learned on a real problem. It will also provide the opportunity to further develop key skills in planning, decision-making, implementation, time management, evaluation, enterprise, employability and citizenship.

The problem you will be working on can be developed either by your group or with support and guidance from your teacher. The data you will use can be existing, open source from the internet, manually captured through surveys, or created through tools such as sensors.

The key goal of this unit is to experience the steps involved in carrying out a data science project, and to understand that planning and implementation are just as critical as the analysis phase. You will get an opportunity to summarise the project and present your next steps towards the end. You will also have an opportunity to self-evaluate what you have learned from the project.

You may progress to more advanced Data Science units on completion of this unit, such as the *Data Science: Project* unit at SCQF level 6 if you wish to continue to improve your knowledge and skills in this area.

This Unit has the Core Skill of Problem Solving at SCQF level 4 embedded in this unit. When a learner achieves the unit, their Core Skills profile will also be updated to include this Core Skill.
