9:00 AM – 11:30 AM				*	X7577	701
Fill in these boxes and r Full name of centre	ead what is print	ted below.	Town			
Forename(s)	Su	irname			Number	of seat
Date of birth Day Mont	h Year	Scottish	candidate	e number		

Total marks — 140

Attempt ALL questions.

Reference may be made to the Physics Relationships Sheet X757/77/11 and the Data Sheet on page 02.

Write your answers clearly in the spaces provided in this booklet. Additional space for answers and rough work is provided at the end of this booklet. If you use this space you must clearly identify the question number you are attempting. Any rough work must be written in this booklet. You should score through your rough work when you have written your final copy.

Care should be taken to give an appropriate number of significant figures in the final answers to calculations.

Use blue or black ink.

Before leaving the examination room you must give this booklet to the Invigilator; if you do not, you may lose all the marks for this paper.

DATA SHEET

COMMON PHYSICAL QUANTITIES

Quantity	Symbol	Value	Quantity	Symbol	Value
Gravitational					
acceleration on Earth	g	9⋅8 m s ⁻²	Mass of electron	me	9·11 × 10 ^{−31} kg
Radius of Earth	R _E	6·4 × 10 ⁶ m	Charge on electron	e	-1.60×10^{-19} C
Mass of Earth	$M_{\rm E}$	6∙0 × 10 ²⁴ kg	Mass of neutron	m _n	1⋅675 × 10 ⁻²⁷ kg
Mass of Moon	M _M	7.3×10^{22} kg	Mass of proton	mp	1⋅673 × 10 ⁻²⁷ kg
Radius of Moon	R _M	1.7 × 10 ⁶ m	Mass of alpha particle	m_{α}	6∙645 × 10 ⁻²⁷ kg
Mean Radius of			Charge on alpha		
Moon Orbit		3∙84 × 10 ⁸ m	particle		3·20 × 10 ^{−19} C
Solar radius		6∙955 × 10 ⁸ m	Planck's constant	h	6∙63 × 10 ^{−34} J s
Mass of Sun		2·0 × 10 ³⁰ kg	Permittivity of free		
1 AU		1∙5 × 10 ¹¹ m	space	ε_0	$8.85 \times 10^{-12} \mathrm{Fm}^{-1}$
Stefan-Boltzmann			Permeability of free		
constant	σ	$5.67 \times 10^{-8} \mathrm{W}\mathrm{m}^{-2}\mathrm{K}^{-4}$	space	μ_0	$4\pi \times 10^{-7} \mathrm{H}\mathrm{m}^{-1}$
Universal constant			Speed of light in		
of gravitation	G	$6.67 \times 10^{-11} \mathrm{m^3 kg^{-1} s^{-2}}$	vacuum	С	$3.00 \times 10^8 \mathrm{ms^{-1}}$
			Speed of sound in		
			air	v	$3.4 \times 10^2 \mathrm{ms^{-1}}$

REFRACTIVE INDICES

The refractive indices refer to sodium light of wavelength 589 nm and to substances at a temperature of 273 K.

Substance	Refractive index	Substance	Refractive index
Diamond Glass Ice	2·42 1·51 1·31	Glycerol Water Air	1·47 1·33 1·00
Perspex	1.49	Magnesium Fluoride	1.38

SPECTRAL LINES

Element	<i>Wavelength</i> /nm	Colour	Element	Wavelength/nm	Colour
Hydrogen	656 486 434	Red Blue-green Blue-violet	Cadmium	644 509 480	Red Green Blue
	410	Violet	Lasers		
	397	Ultraviolet Ultraviolet	Element	Wavelength/nm	Colour
	389		Carbon dioxide	9550 7	Infrared
Sodium	589	Yellow	Helium-neon	10 590 5 633	Red

PROPERTIES OF SELECTED MATERIALS

Substance	<i>Density/</i> kg m ⁻³	Melting Point/ K	Boiling Point/ K	Specific Heat Capacity/ J kg ⁻¹ K ⁻¹	Specific Latent Heat of Fusion/ J kg ⁻¹	Specific Latent Heat of Vaporisation/ J kg ⁻¹
Aluminium	2·70 × 10 ³	933	2623	9.02 × 10 ²	3∙95 × 10⁵	
Copper	8∙96 × 10³	1357	2853	3⋅86 × 10 ²	2·05 × 10⁵	
Glass	2∙60 × 10 ³	1400		6∙70 × 10 ²		
Ice	9∙20 × 10²	273		2.10 × 10 ³	3∙34 × 10 ⁵	
Glycerol	1·26 × 10 ³	291	563	2·43 × 10 ³	1⋅81 × 10 ⁵	8∙30 × 10 ⁵
Methanol	7∙91 × 10 ²	175	338	2∙52 × 10 ³	9∙9 × 10 ⁴	1·12 × 10 ⁶
Sea Water	1.02 × 10 ³	264	377	3∙93 × 10 ³		
Water	1∙00 × 10³	273	373	4⋅18 × 10 ³	3∙34 × 10 ⁵	2·26 × 10 ⁶
Air	1.29					
Hydrogen	9·0 × 10 ^{−2}	14	20	1·43 × 10 ⁴		4∙50 × 10 ⁵
Nitrogen	1.25	63	77	1.04 × 10 ³		2.00 × 10 ⁵
Oxygen	1.43	55	90	9·18 × 10 ²		2.40×10^4

The gas densities refer to a temperature of 273 K and a pressure of 1.01×10^5 Pa.

1. Energy is stored in a clockwork toy car by winding-up an internal spring using a key. The car is shown in Figure 1A.

Figure 1A

The car is released on a horizontal surface and moves forward in a straight line. It eventually comes to rest.

The velocity v of the car, at time t after its release, is given by the relationship

 $v = 0.0071t - 0.00025t^2$

where v is measured in m s⁻¹ and t is measured in s. Using calculus methods:

(a) determine the acceleration of the car 20.0 s after its release;
 Space for working and answer

(b) determine the distance travelled by the car 20.0 s after its release. Space for working and answer 3

* X 7 5 7 7 7 0 1 0 4 *

2. (a) (continued)

MARKS DO NOT WRITE IN THIS MARGIN

3

(iii) The car has a mass of 0.431 kg.

The student now increases the speed of the car to $5.5 \,\mathrm{m \, s^{-1}}$.

The total radial friction between the car and the track has a maximum value of 6.4 N.

Show by calculation that the car cannot continue to travel in a circular path.

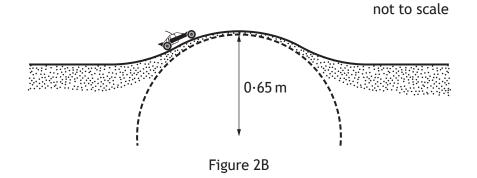

Space for working and answer

[Turn over

2. (continued)

(b) The car is now placed on a track, which includes a raised section. This is shown in Figure 2B.

The raised section of the track can be considered as the arc of a circle, which has radius r of 0.65 m.

(i) The car will lose contact with the raised section of track if its speed is greater than v_{max} .

Show that v_{max} is given by the relationship

$$v_{max} = \sqrt{gr}$$

(ii) Calculate the maximum speed v_{max} at which the car can cross the raised section without losing contact with the track.

Space for working and answer

page 06

2

2

MARKS DO NOT WRITE IN THIS MARGIN

2. (b) (continued)

(iii) A second car, with a smaller mass than the first car, approaches the raised section at the same speed as calculated in (b)(ii).

State whether the second car will lose contact with the track as it crosses the raised section.

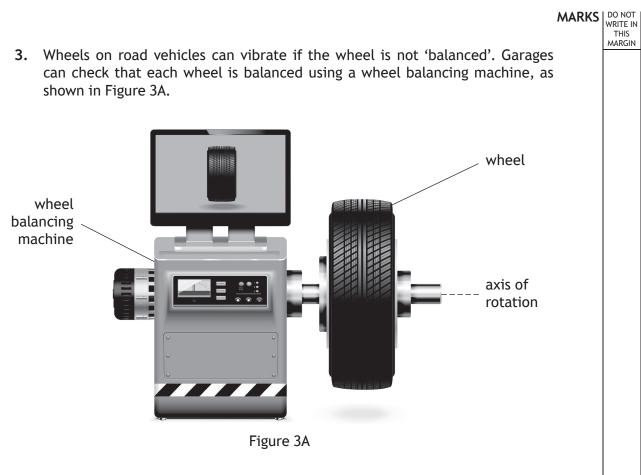

Justify your answer in terms of forces acting on the car.

4. Astronomers have discovered another solar system in our galaxy. The main sequence star, HD 69830, lies at the centre of this solar system. This solar system also includes three exoplanets, b, c, and d and an asteroid belt.

This solar system is shown in Figure 4A.

- Figure 4A
- (a) The orbit of exoplanet d can be considered circular.

To a reasonable approximation the centripetal force on exoplanet d is provided by the gravitational attraction of star HD 69830.

(i) Show that, for a circular orbit of radius r, the period T of a planet about a parent star of mass M, is given by

$$T^2 = \frac{4\pi^2}{GM}r^3$$

MARKS DO NOT WRITE IN THIS MARGIN

4. (a) (continued)

(ii) Some information about this solar system is shown in the table below.

Exoplanet	Type of orbit	Mass in Earth masses	Mean orbital radius in Astronomical Units (AU)	Orbital period In Earth days
b	Elliptical	10.2	-	8.67
с	Elliptical	11.8	0.186	-
d	Circular	18.1	0.63	197

Determine the mass, in kg, of star HD 69830.

Space for working and answer

(b) Two asteroids collide at a distance of 1.58×10^{11} m from the centre of the star HD 69830. As a result of this collision, one of the asteroids escapes from this solar system.

Calculate the minimum speed which this asteroid must have immediately after the collision, in order to escape from this solar system.

3

Space for working and answer

MARKS DO NOT WRITE IN THIS MARGIN

5. (a) Explain what is meant by the term *Schwarzschild radius*.

(b) (i) Calculate the Schwarzschild radius of the Sun. Space for working and answer

(ii) Explain, with reference to its radius, why the Sun is not a black hole.

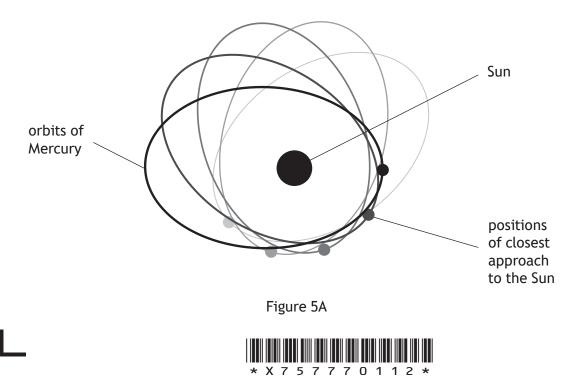

1

3

1

THIS

(c) The point of closest approach of a planet to the Sun is called the perihelion of the planet. The perihelion of Mercury rotates slowly around the Sun, as shown in Figure 5A.

5. (c) (continued)

This rotation of the perihelion is referred to as the precession of Mercury, and is due to the curvature of spacetime. This causes an angular change in the perihelion of Mercury.

The angular change per orbit is calculated using the relationship

$$\phi = 3\pi \frac{r_s}{a(1-e^2)}$$

where:

 ϕ is the angular change **per orbit**, in radians;

 r_s is the Schwarzschild radius of the Sun, in metres;

a is the semi-major axis of the orbit, for Mercury $a = 5.805 \times 10^{10} \text{ m}$;

e is the eccentricity of the orbit, for Mercury e = 0.206.

Mercury completes four orbits of the Sun in one Earth year.

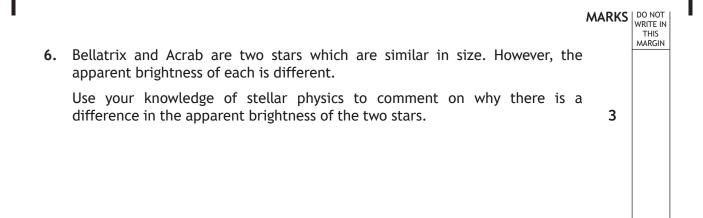

Determine the angular change in the perihelion of Mercury **after one Earth year**.

Space for working and answer

* X 7 5 7 7 7 0 1 1 3 *

7. (a) (continued)

(iv) The momentum of a neutron is measured to be $1\cdot 29 \times 10^{-23}$ kg m s⁻¹ with a precision of $\pm 3\cdot 0\%$.

Determine the minimum **absolute** uncertainty in the position Δx_{min} of this neutron.

Space for working and answer

(b) Some of the neutrons used to investigate the structure of crystal lattices will not produce an observed interference pattern. This may be due to a large uncertainty in their momentum.

Explain why a large uncertainty in their momentum would result in these neutrons being unsuitable for this diffraction process.

8. (a) Inside the core of stars like the Sun, hydrogen nuclei fuse together to form heavier nuclei.

(i) State the region of the Hertzsprung-Russell diagram in which stars like the Sun are located.

(ii) One type of fusion reaction is known as the proton-proton chain and is described below.

$$6_{1}^{1}H \rightarrow {}_{2}^{4}X + 2_{1}^{0}Z + 2_{0}^{0}v + 2_{1}^{1}H + 2_{0}^{0}v$$

Identify the particles indicated by the letters X and Z.

(b) High energy charged particles are ejected from the Sun.State the name given to the constant stream of charged particles which the Sun ejects.

8. (continued)

(c) The stream of particles being ejected from the Sun produces an outward pressure. This outward pressure depends on the number of particles being ejected from the Sun and the speed of these particles.

The pressure at a distance of one astronomical unit (AU) from the Sun is given by the relationship

 $p = 1.6726 \times 10^{-6} \times n \times v^2$

where:

p is the pressure in nanopascals;

n is the number of particles per cubic centimetre;

v is the speed of particles in kilometres per second.

(i) On one occasion, a pressure of 9.56 × 10⁻¹⁰ Pa was recorded when the particle speed was measured to be 6.02 × 10⁵ m s⁻¹.
 Calculate the number of particles per cubic centimetre.
 Space for working and answer

(ii) The pressure decreases as the particles stream further from the Sun.

This is because the number of particles per cubic centimetre decreases and the kinetic energy of the particles decreases.

- (A) Explain why the number of particles per cubic centimetre decreases as the particles stream further from the Sun.
- (B) Explain why the kinetic energy of the particles decreases as the particles stream further from the Sun.

The direction of travel of the wave is taken to be the *x*-direction.

The magnitude of the electric field vector E at any point x and time t is given by the relationship

$$E = 12 \times 10^{-6} \sin 2\pi \left(1.31 \times 10^{14} t - \frac{x}{1.55 \times 10^{-6}} \right)$$

(a) (i) Two points, A and B, along the wave are separated by a distance of 4.25×10^{-7} m in the *x*-direction.

Calculate the phase difference between points A and B. Space for working and answer

3

THIS 10. (a) (continued) (ii) Another two points on the wave, P and Q, have a phase difference of π radians. State how the direction of the electric field vector at point P compares to the direction of the electric field vector at point Q. 1 (i) Show that the speed of the electromagnetic wave in this optical (b) fibre is $2.03 \times 10^8 \,\mathrm{m \, s^{-1}}$. 2 Space for working and answer (ii) The speed v_m of an electromagnetic wave in a medium is given by the relationship $v_m = \frac{1}{\sqrt{\varepsilon_m \mu_m}}$ The permeability μ_m of the optical fibre material can be considered to be equal to the permeability of free space. By considering the speed of the electromagnetic wave in this fibre, determine the permittivity ε_m of the optical fibre material. 2 Space for working and answer

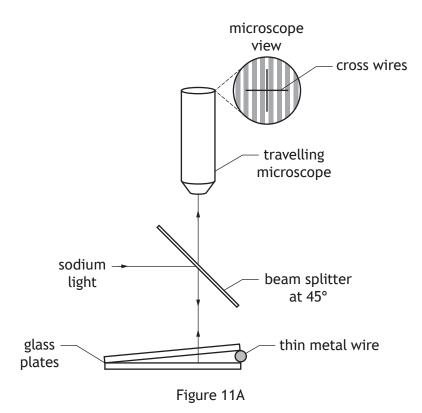

11. A thin air wedge is formed between two glass plates of length 75 mm, which are in contact at one end and separated by a thin metal wire at the other end.

DO NOT WRITE IN

THIS

Figure 11A shows sodium light being reflected down onto the air wedge.

A travelling microscope is used to view the resulting interference pattern.

A student observes the image shown in Figure 11B.

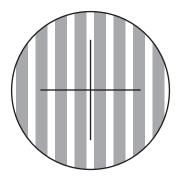

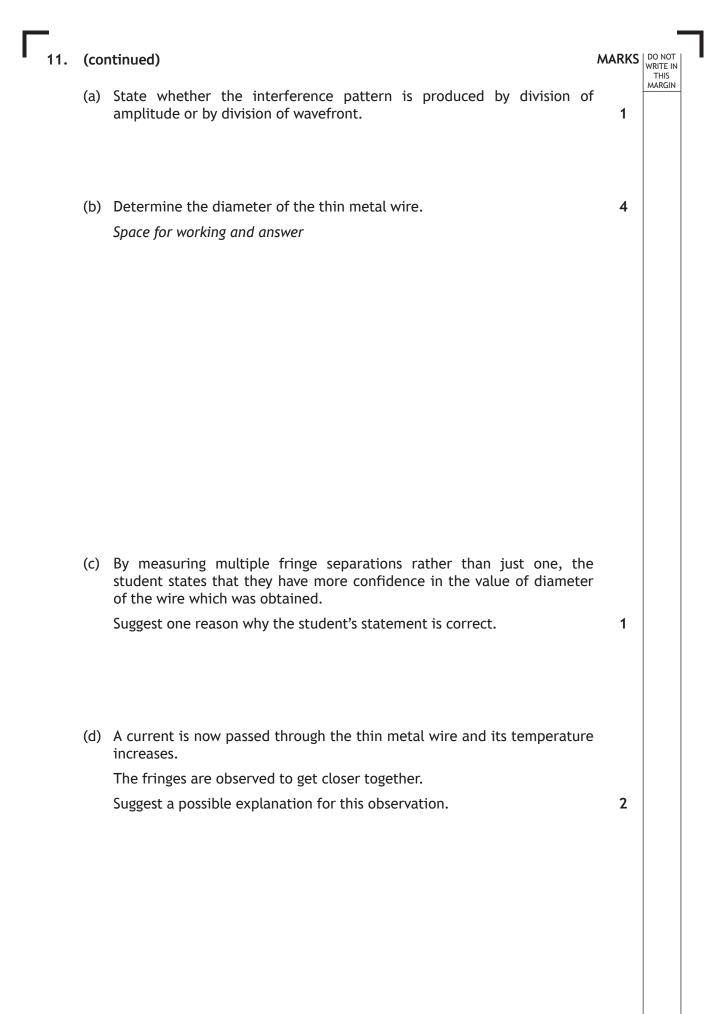

Figure 11B

The student aligns the cross-hairs to a bright fringe and then moves the travelling microscope until 20 further bright fringes have passed through the cross-hairs and notes that the travelling microscope has moved a distance of 9.8×10^{-4} m.

The student uses this data to determine the thickness of the thin metal wire between the glass plates.

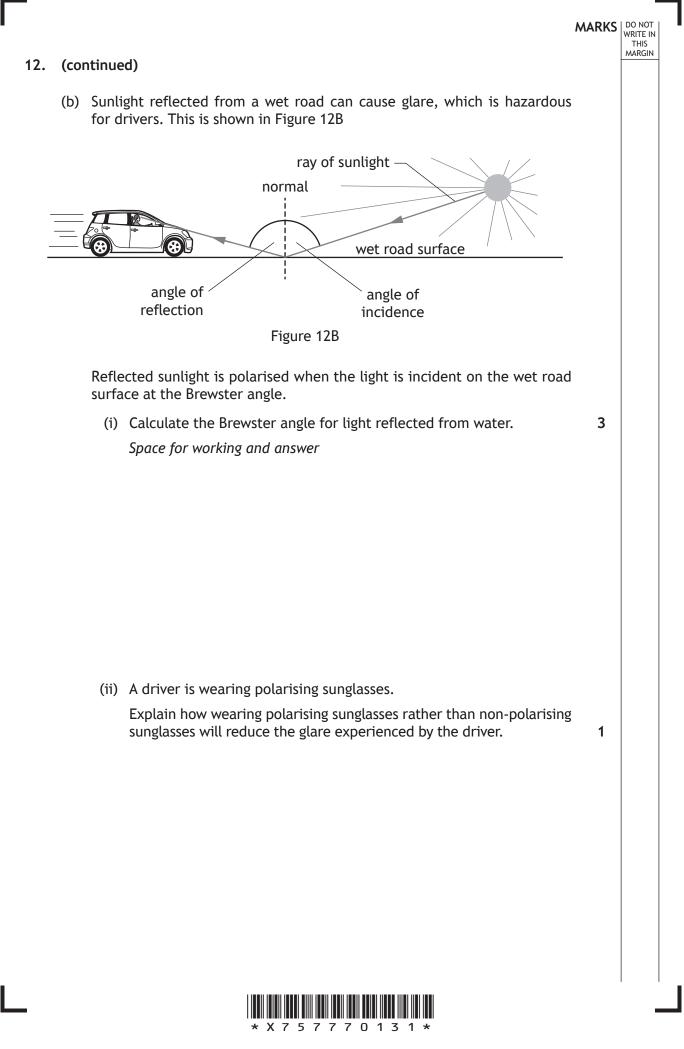

THIS **12.** A student is observing the effect of passing light through polarising filters. Two polarising filters, the polariser and the analyser, are placed between a lamp and the student as shown in Figure 12A. The polariser is held in a fixed position, and the analyser can be rotated. Angle θ is the angle between the transmission axes of the two filters. unpolarised light source analyser rotated θ through angle θ transmission axis of the polariser transmission axis of the analyser Figure 12A When the transmission axes of the polariser and the analyser are parallel, θ is 0° and the student observes bright light from the lamp. (a) (i) Describe, in terms of brightness, what the student observes as the 2 analyser is slowly rotated from 0° to 180°. (ii) The polariser is now removed. Describe, in terms of brightness, what the student observes as the analyser is again slowly rotated from 0° to 180° 1

13. (a) State what is meant by *electric field strength*.

(b) Two identical spheres, each with a charge of +22 nC, are suspended from point P by two equal lengths of light insulating thread.

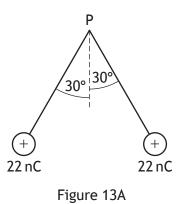

The spheres repel and come to rest in the positions shown in Figure 13A.

MARKS DO NOT

1

2

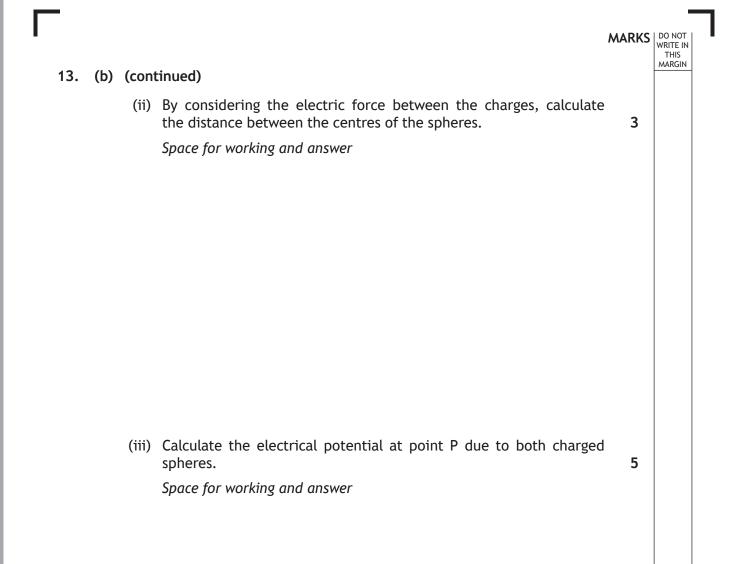

THIS

(i) Each sphere has a weight of 9.80×10^{-4} N.

By considering the forces acting on one of the spheres, show that the electric force between the charges is $5 \cdot 66 \times 10^{-4}$ N. Space for working and answer

14. A student carries out an experiment to determine the charge to mass ratio of the electron.

DO NOT WRITE IN THIS MARGIN

Figure 14A

An electron beam is produced using an electron gun connected to a 5.0 kV supply. A current I in the Helmholtz coils produces a uniform magnetic field.

The electron beam enters the magnetic field.

The apparatus is set up as shown in Figure 14A.

The path of the electron beam between points O and P can be considered to be an arc of a circle of constant radius r. This is shown in Figure 14B.

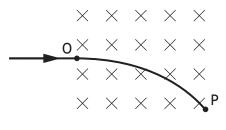

Figure 14B

The student records the following measurements:

Electron gun supply voltage, V	5∙0 kV (±10%)
Current in the Helmholtz coils, I	0·22 A (±5%)
Radius of curvature of the path of the electron beam between O and P, <i>r</i>	0·28 m (±6%)

14. (continued)MARKSDO NOT
WRITE IN
THIS
MARGIN(a) The manufacturer's instruction sheet states that the magnetic field
strength B at the centre of the apparatus is given by $B = 4 \cdot 20 \times 10^{-3} \times I$ $B = 4 \cdot 20 \times 10^{-3} \times I$ Calculate the magnitude of the magnetic field strength in the centre of
the apparatus.1Space for working and answer1

(b) The charge to mass ratio of the electron is calculated using the following relationship

$$\frac{q}{m} = \frac{2V}{B^2 r^2}$$

(i) Using the measurements recorded by the student, calculate the charge to mass ratio of the electron.

Space for working and answer

(ii) Determine the absolute uncertainty in the charge to mass ratio of the electron.

Space for working and answer

2

14. (continued)

- MARKS DO NOT WRITE IN THIS MARGIN
- (c) A second student uses the same equipment to find the charge to mass ratio of the electron and analyses their measurements differently.

The current in the Helmholtz coils is varied to give a range of values for magnetic field strength. This produces a corresponding range of measurements of the radius of curvature.

The student then draws a graph and uses the gradient of the line of best fit to determine the charge to mass ratio of the electron.

Suggest which quantities the student chose for the axes of the graph.

3

14. (continued)

(d) The graphical method of analysis used by the second student should give a more reliable value for the charge to mass ratio of the electron than the value obtained by the first student.

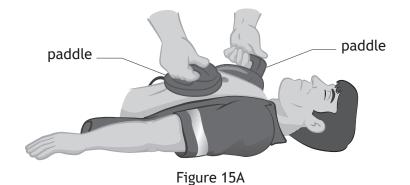

Use your knowledge of experimental physics to explain why this is the case.

15. A defibrillator is a device that gives an electric shock to a person whose heart has stopped beating normally.

DO NOT WRITE IN THIS MARGIN

This is shown in Figure 15A.

Two paddles are initially placed in contact with the patient's chest. A simplified defibrillator circuit is shown in Figure 15B.

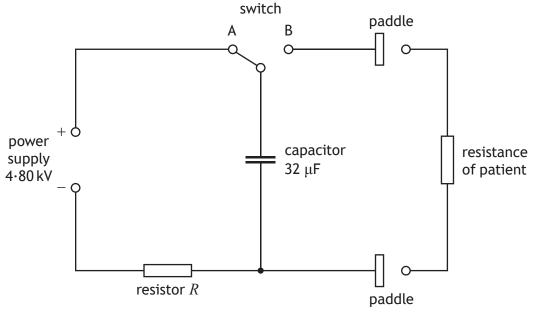

Figure 15B

When the switch is in position A, the capacitor is charged until there is a large potential difference across the capacitor.

15.	(cor	ntinued)	MARKS	DO NOT WRITE IN THIS MARGIN
	(a)	The capacitor can be considered to be fully charged after 5 time constants.		
		The time taken for the capacitor to be considered to be fully charged is 10.0s .		
		Determine the resistance of resistor <i>R</i> .	3	
		Space for working and answer		
	(b)	During a test, an 80.0 Ω resistor is used in place of the patient.		

The switch is moved to position B, and the capacitor discharges through the 80.0 Ω resistor.

The initial discharge current is 60 A.

The current in the resistor will fall to half of its initial value after 0.7 time constants.

Show that the current falls to 30 A in 1.8 ms.

Space for working and answer

15. (continued)

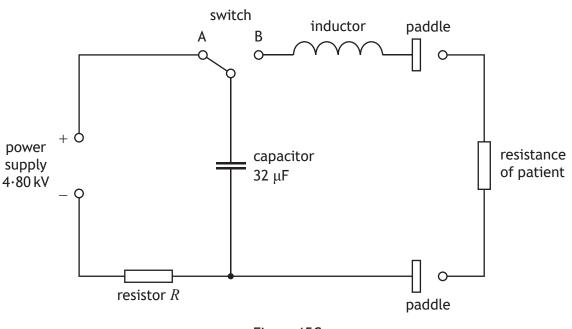

(c) In practice a current greater than 30 A is required for a minimum of $5 \cdot 0 \text{ ms}$ to force the heart of a patient to beat normally.

An inductor, of negligible resistance, is included in the circuit to increase the discharge time of the capacitor to a minimum of $5.0 \, \text{ms}$.

MARKS DO NOT WRITE IN

3

THIS

This is shown in Figure 15C.

Figure 15C

(i) The inductor has an inductance of 50.3 mH.

The capacitor is again fully charged. The switch is then moved to position B.

Calculate the rate of change of current at the instant the switch is moved to position B.

Space for working and answer

15. (c) (continued)

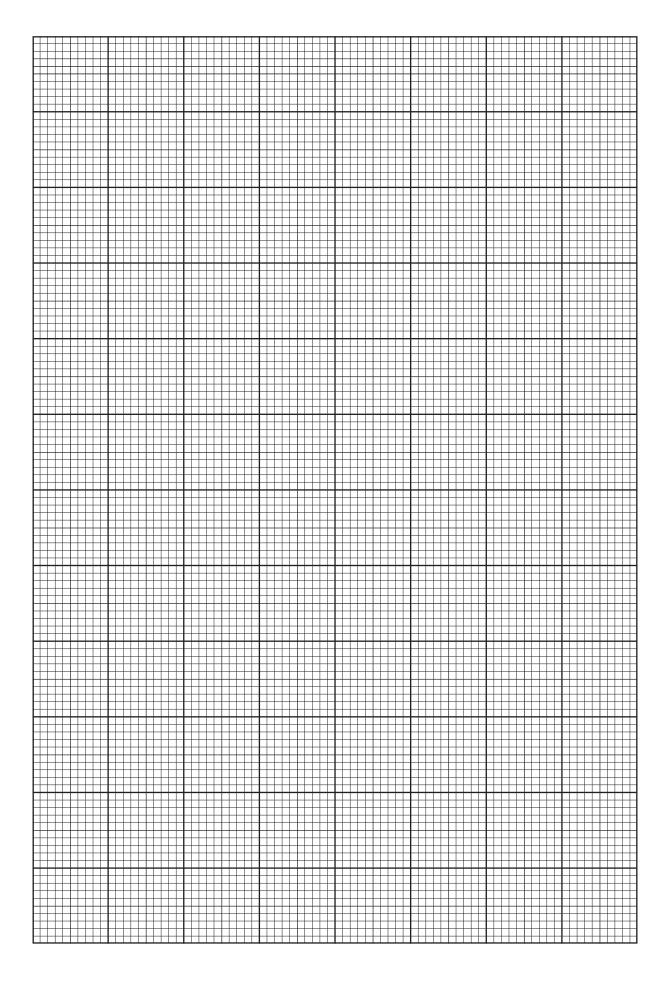

(ii) It would be possible to increase the discharge time of the capacitor with an additional resistor connected in the circuit in place of the inductor. However, the use of an additional resistor would mean that maximum energy was not delivered to the patient.

Explain why it is more effective to use an inductor, rather than an additional resistor, to ensure that maximum energy is delivered to the patient.

 $v = H_0 d$

Additional Relationships

Circle

circumference = $2\pi r$

area = πr^2

Sphere

area = $4\pi r^2$

volume = $\frac{4}{3}\pi r^3$

Trigonometry

 $\sin \theta = \frac{\text{opposite}}{\text{hypotenuse}}$

 $\cos \theta = \frac{\text{adjacent}}{\text{hypotenuse}}$

 $\tan \theta = \frac{\text{opposite}}{\text{adjacent}}$

 $\sin^2\theta + \cos^2\theta = \mathbf{1}$

Moment of inertia

point mass $I = mr^2$

rod about centre $I = \frac{1}{12}ml^2$

rod about end $I = \frac{1}{3}ml^2$

disc about centre
$$I = \frac{1}{2}mr^2$$

sphere about centre $I = \frac{2}{5}mr^2$

Table of standard derivatives

f(x)	f'(x)
sin ax	a cos ax
cos ax	$-a\sin ax$

Table of standard integrals

f(x)	$\int f(x)dx$
sin ax	$-\frac{1}{a}\cos ax + C$
cos ax	$\frac{1}{a}\sin ax + C$
