

**X826/76/11**

**Environmental Science  
Paper 1 — Supplementary source booklet**

Duration — 45 minutes

---

**Supplementary sources of information**

**Source A** is a sketch map showing the shingle banks and location of Settlement X.

**Source B** is an image showing forestry plantation on inland shingle banks, including gorse encroachment.

**Source C** is a table showing the SSSI designations in this area and reasons for their designation.

**Source D** is a list of particular risks to Scotland identified in the UK Climate Change Risk Assessment (2017).

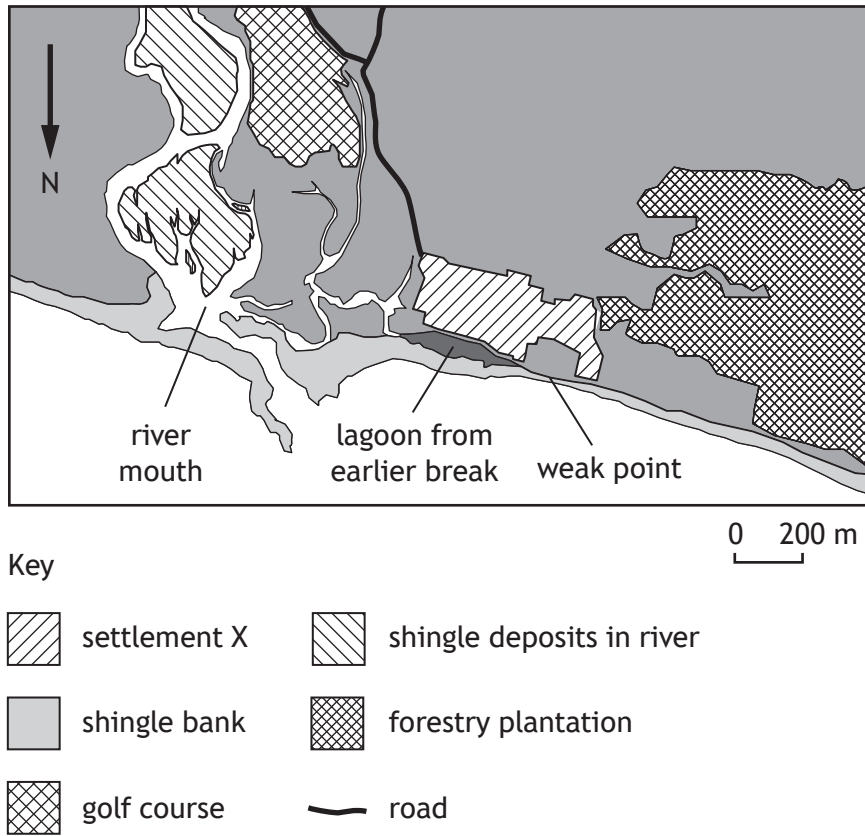

**Source E** is a table showing the estimated costs of coastal engineering options at the estuary in 1996.

**Source F** is a graph showing the change in value of £100 between 1996 and 2020 when adjusted for inflation.

**Source G** is a table showing the advantages and disadvantages of coastal engineering approaches used to manage coastal erosion.

Source A Sketch map showing the shingle banks and location of Settlement X

Source B Image showing forestry plantation on inland shingle banks, including gorse encroachment

**Source C** SSSI designations in the area and reasons for their designation

Designation	Feature	Species
Estuary SSSI and river SSSI	<ul style="list-style-type: none"> <li>coastal geomorphology</li> <li>river morphology</li> <li>saltmarsh</li> <li>shingle</li> <li>wet woodland</li> </ul>	<ul style="list-style-type: none"> <li>plant communities</li> <li>Atlantic salmon, sea lamprey, freshwater pearl mussel, otter</li> <li>butterflies — small blue, dingy skipper</li> </ul>

**Source D** Particular risks to Scotland identified in the UK Climate Change Risk Assessment (2017)

- Species and habitats, from the changing climate
- Soils and natural carbon stores
- People, communities, and buildings, from flooding
- Coastal areas, from sea level rise combined with extreme weather events
- Marine species, from ocean changes
- Health and wellbeing

**Source E** Estimated costs of coastal engineering options at the estuary in 1996

Offshore breakwater	Rock armour	Rock groynes	Beach nourishment (over 50 years)	Emergency work (over 50 years)
£1.85 million	£6.84 million	£1.94 million	£3.59 million	£776,554

**Source F** Change in value of £100 between 1996 and 2020 when adjusted for inflation

**Source G** Advantages and disadvantages of coastal engineering approaches used to manage coastal erosion

	<b>Approach</b>	<b>Advantages</b>	<b>Disadvantages</b>
<b>Hard engineering</b>	Breakwater — placed 200 m offshore, near weak point	<ul style="list-style-type: none"> <li>• one-off construction</li> <li>• minimal maintenance once in place</li> <li>• will trap shingle coming downriver</li> <li>• will break the waves and absorb their energy</li> <li>• habitat potential for marine species eg lobsters, mussels</li> </ul>	<ul style="list-style-type: none"> <li>• requires seabed survey and modelling</li> <li>• lengthy planning and construction processes</li> <li>• below-water construction, with disturbance of sea bed</li> <li>• may act as barrier to anadromous species</li> </ul>
	Rock armour — large boulders placed in front of shorefront shingle banks	<ul style="list-style-type: none"> <li>• easy to maintain</li> <li>• will break the waves and absorb their energy</li> </ul>	<ul style="list-style-type: none"> <li>• financial and environmental impacts of transporting rock</li> <li>• visual impact if imported rocks differ from local geology</li> </ul>
	Rock groynes — mesh cages containing rocks, placed at right angles to the coast	<ul style="list-style-type: none"> <li>• will trap shingle carried along the shore by coastal currents</li> </ul>	<ul style="list-style-type: none"> <li>• minimum height of 6.5 m needed, plus extensive below ground engineering</li> <li>• visual impact</li> <li>• reduces localised erosion but enhances it further along coast</li> <li>• disruption of coastal processes and disturbance of species could threaten SSSI status</li> </ul>
<b>Soft engineering</b>	Beach nourishment — local shingle deposits are moved back into place, or replacement of lost shingle	<ul style="list-style-type: none"> <li>• not visually intrusive if the same materials are used</li> <li>• allows natural geomorphological processes to continue</li> </ul>	<ul style="list-style-type: none"> <li>• impacts of transporting shingle</li> <li>• disturbance of shingle and species could impact SSSI status</li> <li>• requires constant monitoring and maintenance</li> </ul>
	Managed retreat — allowing waves to break through shingle and flood the land behind	<ul style="list-style-type: none"> <li>• encourages development of saltmarsh behind the shingle bank, which breaks waves and absorbs their energy</li> </ul>	<ul style="list-style-type: none"> <li>• only used if land behind is of low value</li> <li>• potential loss of Settlement X</li> <li>• seawater incursion could affect groundwater quality</li> </ul>
	Emergency work only		<ul style="list-style-type: none"> <li>• would require planning to provide short-notice to Settlement X residents.</li> <li>• could not be scheduled to protect anadromous species or nesting birds</li> </ul>
