Attempt ALL questions.

You may use a calculator.

Question 15 contains a choice.

Write your answers clearly in the spaces provided in this booklet. Additional space for answers and rough work is provided at the end of this booklet. If you use this space you must clearly identify the question number you are attempting. Any rough work must be written in this booklet. Score through your rough work when you have written your final copy.

Use blue or black ink.

Before leaving the examination room you must give this booklet to the Invigilator; if you do not, you may lose all the marks for this paper.

Question 15 contains a choice

1. The diagram represents the structure of a section of DNA.

- (a) (i) Name the repeating units that make up DNA.
 - (ii) Name the parts of these units, joined by strong bonds, that make up the backbone of DNA.

_____ and _____

(iii) Identify one letter from the diagram that labels the 3' end of a DNA strand.

MARKS DO NOT WRITE IN THIS MARGIN (a) The diagram represents stages of an enzyme-catalysed reaction. substrate stage 2 stage 1 products enzyme active site (i) Use the diagram to explain why this reaction can be described as catabolic. 1 (ii) The diagram shows induced fit occurring between the enzyme and its substrate molecule. Describe what happens during induced fit. 1 (iii) Once the reaction is complete the products are released from the active site and the enzyme can be reused. Explain why the products leave the active site. 1

2.

2. (continued)

(b) Parkinson's disease is caused by low levels of dopamine in the brain resulting in poor muscle co-ordination. Parkinson's disease can be treated using the drug L-dopa, which is converted to dopamine in the brain.

L-dopa is produced commercially in a reaction vessel using the enzyme tyrosinase as shown.

The graph shows the results of using different concentrations of the substrate tyrosine on the concentration of L-dopa produced in the reaction vessel.

Using information from the graph, suggest why a tyrosine concentration of 5 mg/cm^3 is used in the commercial production of L-dopa.

(c) Many enzymes are used in commercial processes. When using enzymes in these processes the end-product is regularly removed.

Suggest why end-products are removed during production processes.

- MARKS DO NOT WRITE IN THIS MARGIN Succinate is converted to fumarate by a dehydrogenase enzyme as shown. 3. succinate dehydrogenase succinate -► fumarate + hydrogen The rate of this reaction can be measured using the indicator DCPIP, which changes colour from blue to colourless when it combines with hydrogen. An investigation was carried out into the effect of an inhibitor on the rate of this reaction at different concentrations of succinate. Five test tubes were set up as shown in the diagram, each test tube contained a different concentration of succinate. 5 cm³ succinate 1 cm³ inhibitor 1 drop DCPIP 1 cm³ succinate dehydrogenase The time to decolourise the DCPIP indicator in each tube was measured. The investigation was repeated without the inhibitor. The results of the investigation are shown in the table. 12. An investigation was carried out into the effect of background rock music on the ability to recall words in a list.

THIS MARGIN

Students of the same age were arranged into two groups of 20. At the same time of day, each group listened to a list of 10 words being read aloud.

While the words were being read out, one group was played rock music. After the words were read out the music was stopped, and each student was asked to write down the words they had heard.

The other group was a control group.

The results are shown in the tables.

| Rock m | usic group |
|--------------------------|---|
| Position of word in list | Number of students recalling word |
